4. What's new in pip 26.1 - lockfiles and dependency cooldowns!

What's new in pip 26.1 - lockfiles and dependency cooldowns! Richard Si describes an excellent set of upgrades to Python's default pip tool for installing dependencies. This version drops support for Python 3.9 - fair enough, since it's been EOL since October . macOS still ships with python3 as a default Python 3.9, so I tried out the new Python version against Python 3.14 like this: `uv python install 3.14 mkdir /tmp/experiment cd /tmp/experiment python3.14 -m venv venv source venv/bin/activate pip install -U pip pip --version` This confirmed I had pip 26.1 - then I tried out the new lock files: `pip lock datasette llm` This installs Datasette and LLM and all of their dependencies and writes the whole lot to a 519 line pylock.toml file - here's the result . The new release also supports dependency cooldowns, discussed here previously , via the new `--uploaded-prior-to PXD` option where X is a number of days. The format is `P-number-of-days-D` , following ISO duration format but only supporting days. I shipped a new release of LLM, version 0.31, three days ago . Here's how to use the new `--uploaded-prior-to P4D` option to ask for a version that is at least 4 days old. `pip install llm --upl...`

Tom Warren, The Verge (gift link): ?Many of these employees have spent years, and in some cases, decades, shaping Microsoft into what it is today,? says Microsoft?s HR chief Amy Coleman in a memo seen by The Verge. ?For those who may be considering their next chapter, we?re offering a one?time Voluntary Retirement Program.? Microsoft says it applies to only a ?small percentage of our US employees.? US employees whose combined years of service added to their age totals 70 or more will be eligible for voluntary retirement, and Coleman says this will

include ?generous company support.? It?s not clear if this is a precursor to more layoffs at Microsoft, but it certainly looks like a method to avoid a bigger round of layoffs ahead of Microsoft?s new financial year in July. 70 combined years? My god, when did Microsoft get so, well, soft ? I just read about a guy at Apple whose age plus years of employment will hit something like 114 later this year. If I weren?t so lazy I?d double check the exact number with a calculator , but whatever it?s up to today, he hit 70 combined years back around the time the first iMac came out. ?

Rachel Metz, reporting for Bloomberg: A small group of unauthorized users have accessed Anthropic PBC?s new Mythos AI model, a technology that the company says is so powerful it can enable dangerous cyberattacks, according to a person familiar with the matter and documentation viewed by Bloomberg News. A handful of users in a private online forum gained access to Mythos on the same day that Anthropic first announced a plan to release the model to a limited number of companies for testing purposes, said the person, who asked not to be named for fear of reprisal. The group has been using Mythos regularly since then, though not for cybersecurity purposes, said the person, who corroborated the account with screenshots and a live demonstration of the model. GitHub was not the first home of my Open Source software. SourceForge was . Before GitHub, I had my own Trac installation. I had Subversion repositories, tickets, tarballs, and documentation on infrastructure I controlled. Later I moved projects to Bitbucket, back when Bitbucket still felt like a serious alternative place for Open Source projects, especially for people who were not all-in on Git yet. And then, eventually, GitHub became the place, and I

moved all of it there. It is hard for me to overstate how important GitHub became in my life. A large part of my Open Source identity formed there. Projects I worked on found users there. People found me there, and I found other people there. Many professional relationships and many friendships started because some repository, issue, pull request, or comment thread made two people aware of each other. That is why I find what is happening to GitHub today so sad and so disappointing. I do not look at it as just the folks at Microsoft making product decisions I dislike. GitHub was part of the social infrastructure of Open Source for a very long time. For many of us, it was not merely where the code lived; it was where a large part of t...

I mentioned before that I've been switching some libvirt-based virtual machines to UEFI . I've recently had to do some more things there, which has led me to discover what's important about the XML parts of your libvirt machine definitions for this. Or at least, what's important if you use virt-manager to change things. (There's a long story that boils down to libvirt external snapshots not playing well with virtual CD-ROMs, BIOS PXE booting being annoying, and UEFI Secure Boot causing the Ubuntu 26.04 GRUB to refuse to touch the Ubuntu 22.04 installer kernel.) As mentioned in the previous entry , what determines whether the machine boots into UEFI or BIOS is whether or not the XML node has a " firmware='efi' " attribute set on it. Once you have UEFI firmware, the XML node can have a ' ' node with some ' ' nodes that tell it what to do about Secure Boot: hvm By itself this isn't a fully specified UEFI set of attributes, because you need and elements as well, and these vary based on your secure-boot and enrolled-keys settings. Conveniently for me, if you edit your XML in virt-manager, don't have (or remove) the and elements, and then pick the 'Apply' button, virt-manager will pick...

Pick almost any open source supply chain incident from the past eighteen months and trace it back, and you end up reading a .github/workflows YAML file. Ultralytics shipping a crypto miner to PyPI, the nx packages that turned thousands of developer machines into credential harvesters, tj-actions leaking secrets from 23,000 repositories, Trivy getting compromised twice in three weeks, elementary-data publishing a malicious wheel ten minutes after a stranger left a GitHub comment. Different headline payloads, different victims, and in each case a GitHub Actions feature behaving exactly as documented. I wrote in December about the narrow problem of Actions being a package manager with no lockfile, no integrity hashes and no transitive visibility, and that the uses: line is a dependency declaration that the runner

re-resolves on every execution against mutable git tags. That argument still stands and has since been demonstrated rather thoroughly in production, but it's only one face of a larger problem. The whole product is a collection of features that are each convenient on their own and very easy to assemble into something dangerous, and the workflows building and publishing most o...

15. 10Gb Ethernet: what I had to (re)learn

Link: <https://www.gilesthomas.com/2026/04/10g-ethernet-what-i-relearned>

My ISP recently started offering a 10Gb option, and my "shiny new thing!" Pavlovian response immediately kicked in. So of course, I had to upgrade the wired networking in my home -- which meant I had to learn a few things to get it all working, and relearn a bunch of stuff I'd forgotten over the years. Wired networking for home and small offices hasn't really moved forward that much in the last 20-odd years. Back in 2006, gigabit Ethernet was standard for businesses, and most home users moved to it not long after. Perhaps due to the rise of WiFi for most "last few metres" connections, it's pretty much stagnated there, perhaps with a bit of a push towards 2.5Gb/s more recently. But with faster ISP connections arriving, I think things are starting to become a bit more interesting. Even the fastest WiFi 7 connections are only able to get up to around 6Gb/s to a single device -- and that's in an ideal "super-fast machine sitting right next to the AP in a shielded lab" setup. Here's what I had to drag up from my memory, and the new stuff I had to learn, in order to get this all working. I'll write about the background in this post, and then tomorrow I'll post about what I actually put...

Link: <https://blog.jim-nielsen.com/2026/collective-speed-isnt-the-sum-of-individual-speed/>

I've been thinking about speed which is why Chris Coyier caught my attention in his latest piece discussing how AI might be 10xing the speed with which we code, but it's not making our software 10x better: Faster individuals don't make a fast company. My mind immediately went to the 4x100 relay at the Olympics. (Not sure which race that is? Watch the London 2012 one .) Imagine you were put in charge of winning the 4x100 relay. All you gotta do is find the four faster sprinters in your country ? right? I'm no track and field expert, but I doubt it's that simple. In a relay race, the baton is arguably the most critical element. Passing it cleanly is vital because if you fumble it you're easily behind a few meters or maybe even disqualified. So, one could argue, a sprinter's ability to pass and receive the baton is more important than speed because all the speed in the world won't help you overcome a dropped baton. (There are other considerations too, like which leg each runner takes, which sequence works best given individual pairings and rapport, and whether a slower veteran might perform better in the heat of the moment.) Faster runners won't guarantee a faster team. And faster cod...

21. Illegal vs Unwanted States

Source: Computer Things | Published: Tue, 28 Apr 2026 15:14:09 +0000

Link: <https://buttondown.com/hillelwayne/archive/illegal-vs-unwanted-states/>

An illegal state is a state we never want our system to be in. An unwanted state is a state we don't want to stay in. Many states that we wish were illegal are actually unwanted. Considering a calendaring software which stores calendar events as `{user: {events: [event]}}`, where each event has a start and end time. This allows one person to attend two events at the same time. We might consider this illegal and replace the data type with `{user: {time: optional event}}` which makes this impossible. However, a scheduling conflict isn't illegal, only unwanted! It is possible for a person to sign up for two overlapping events. Maybe they're supposed to choose one event, maybe they'll decide which event to go to later, maybe one of the events doesn't actually represent an in-person meeting. In that case it's acceptable, if not ideal, to remain in the unwanted state. Other unwanted states lead to invalid states if not exited quickly. An airline flight is in an unwanted state if there are more passengers booked to fly than seats available. This must be resolved before passengers actually board, as "more passengers physically on the plane than seats available" is an illegal state. In some c...

Second, source code hosting has moved to Codeberg . Codeberg is the third home of this 17 year old project. QuickQWERTY was first hosted on SourceForge in 2008, where it remained for seven years. In 2015, the project moved to GitHub. It has now moved once again, this time to Codeberg. As before, QuickQWERTY continues to be available under the terms of the MIT licence. Link: <https://anildash.com/2026/04/28/one-good-ai-is-here/>

The cultural battles over AI have broken down over predictable lines in the past few years, with critics rightfully calling out the big AI platforms for training on content without consent, recklessly building without considering environmental impact, and designing platforms that are unaccountable because their code and weights (the parameters that describe how an AI model works) aren't open for third-parties to evaluate. The AI zealots have done themselves no favors, by not only dismissing all of these valid criticisms, but by also making increasingly outlandish and extreme claims about the capabilities of the Big AI platforms, while simultaneously scaremongering about the brutal effect they'll have on people's lives and careers. It's no wonder the public sentiment about AI has become so negative. But a small cohort of us who are curious about LLMs as a technology, yet deeply critical of Big AI companies for their impact on society, have been asking what would "good" AI look like? Is it possible to make versions of these technologies that provide real benefits, and actually help people, without all of the attendant harms?
