

1. datasette 1.0a30

Source: Simon Willison's Weblog | Published: 2026-05-24T23:52:37+00:00

Link: <https://simonwillison.net/2026/May/24/datasette/#atom-everything>

Release: datasette 1.0a30 The big new feature in this alpha is a new customizable "Jump to..." menu, described in detail in The extensible "Jump to" menu in Datasette 1.0a30 on the Datasette blog. You can try it out by hitting / on latest.datasette.io - it looks like this: The new `jump_items_sql()` plugin hook allows plugins to add their own items to the set that's searched by the plugin. 2. datasette-agent 0.1a4

Source: Simon Willison's Weblog | Published: 2026-05-24T23:19:34+00:00

Link: <https://simonwillison.net/2026/May/24/datasette-agent/#atom-everything>

Release: datasette-agent 0.1a4 Taking advantage of the new `makeJumpSections()` JavaScript plugin hook added in Datasette 1.0a30 , datasette-agent now presents this "Start a new agent chat" interface as part of the Jump to menu, any time you hit / : You can try this out by signing into agent.datasette.io using your GitHub account. Tags: datasette , datasette-agent

3. datasette-fixtures 0.1a0

Source: Simon Willison's Weblog | Published: 2026-05-24T21:38:32+00:00

Link: <https://simonwillison.net/2026/May/24/datasette-fixtures/#atom-everything>

Release: datasette-fixtures 0.1a0 One of the smaller features in Datasette 1.0a30 is this: New documented `datasette.fixtures.populate_fixture_database(conn)` helper for creating the fixture database tables used by Datasette's own tests, intended for plugin test suites. This new plugin takes advantage of that API. You can try it out using `uvx` without even installing Datasette like this: `uvx --prerelease=allow --with datasette-fixtures datasette \ --get /fixtures/roadside_attractions.json` Which outputs:

```

4. Why Steve Kerr Stayed With the Warriors

Source: Daring Fireball | Published: 2026-05-24T17:27:24Z

Link: https://www.espn.com/nba/story/_/id/48686303/steve-kerr-decision-return-coach-golden-state-warriors-steph-curry

Terrific, poignant profile of Warriors head coach Steve Kerr by Wright Thompson for ESPN: Kerr doesn't want the Warriors to end up like the New England Patriots, marred by grudges and grievances. He watched Michael Jordan retire, then unretire, then retire, then unretire. His friends used to grill him about MJ. Why doesn't he go out on top?? Because he can't, Kerr told them. For the past few years, Kerr has watched his mentor, San Antonio Spurs coach Gregg Popovich, struggle through this same decision. Pop once called Steve to tell him he'd finally decided to retire. Steve congratulated him on a Hall of Fame career. A week later Pop signed an extension with San Antonio. Popovich finally officially quit six weeks before our lunch, six months after a stroke diminished him physically. People who loved him had to show him the door, as gently as possible. That hurt Steve. He respects Popovich so much. He loved playing for him and coaching with him. He once told Gregg he was the finest man he'd ever known and thanked him for all he'd done for him. Pop smiled and said his feet were made of clay like everyone else's. Steve didn't believe it then. Now he does. I realized he couldn't do...

5. The Verge: ?The 13 Biggest Announcements at Google I/O 2026?

Source: Daring Fireball | Published: 2026-05-21T01:47:24Z

Andrew Liszewski and Stevie Bonifield, writing for The Verge (gift link): Google's I/O 2026 keynote today was once again full of AI-related announcements including a new family of Gemini 3.5 AI models, new features for Search and Gmail, and updates about its Project Aura smart glasses. If you weren't able to tune into the event's livestream today or follow along with our live blog , you can catch up on everything you missed in our roundup below. This roundup was the only way I could really make sense out of Google I/O. ?

6. Existing Stakeholders Have a Say in the Future

Source: Daring Fireball | Published: 2026-05-18T16:47:08Z

Link: https://daringfireball.net/2026/05/ai_is_technology_not_a_product

A follow-up point on my ? AI Is Technology, Not a Product ? column over the weekend. Here?s a repeat of Steven Levy?s argument that John Ternus must direct Apple towards building ?a killer AI product?: By the end of this decade, it?s unlikely that people will swipe on their phones to tap on Uber or Lyft. They will just tell their always-on AI agent to get them home. Or that agent will have already figured out where they need to go, and the car will be waiting without the friction of a request. ?There?s an app for that,? may be replaced by ?Let the agent do that.? Putting aside whether this is technically feasible or psychologically comfortable, what Levy is arguing here is yadda-yadda-yadda-ing over Uber and Lyft?s say in the matter. Those two companies are now deeply entrenched. They might get disrupted. (Google?s Waymo isn?t operating here in Philly yet, but I see their vehicles around the city all the time now. You can?t miss them .) But I think it?s a good bet that most ride shares at the end of this decade (which is Levy?s own timeline) will largely be Ubers and Lyfts. Uber and Lyft get to decide the terms of which platforms they?re hail-able from. Here?s a note a friend sent...

7. An idea: user level WireGuard for UDP based encryption and authentication

Source: Chris's Wiki :: blog | Published: 2026-05-24T14:26:01Z

Link: <https://utcc.utoronto.ca/~cks/space/blog/tech/WireGuardForUDPAuthEncryption>

In some environments, you want to connect programs together with mutual authentication and encryption of their traffic (so each end can trust the other and the traffic is immune to easy eavesdropping). If the programs are talking to each other over TCP, there's a well developed solution for this in the form of mutual TLS (mTLS) (although you'll probably get to enjoy the fun of running your own private Certificate Authority). But if you're using UDP, things are less clear. When this came up recently in a Fediverse discussion I was a peripheral part of, it occurred to me that we already have an existing, well regarded, UDP-based mechanism for authentication and encryption in the form of WireGuard. (Yes, there's QUIC , but that still leaves you with TLS and it gives you a reliable stream model instead of a UDP model.) WireGuard is normally used to create general networking connections between two machines, a connection that other programs can use to pass whatever traffic they want. But in theory it doesn't have to be used this way. There are purely user-level WireGuard libraries, and if you have a suitable library, you can have the program it's embedded in receive and handle the pack...

8. Building Pi With Pi

Source: Armin Ronacher's Thoughts and Writings | Published: 2026-05-24T00:00:00+00:00

Link: <https://lucumr.pocoo.org/2026/5/24/pi-oss/>

Pi is now part of Earendil, but in the important sense it is still Mario's project. He has been living with its issue tracker longer than I have, and he has been exposed to the weirdness of the new form of agent traffic in Open Source projects for longer too. This post is mostly a reflection of my own experience after spending more time in the tracker, using Pi to work on Pi, and watching what I have learned about it so far.

Pi to build Pi. That sounds like a cute dogfooding thing but it really helps understand what we do. An interesting effect of building with agents is that it changes the role of the issue tracker a tiny bit. The issue descriptions are not just messages from a user to a maintainer because we also use them as inputs for prompts in Pi sessions. It is something I might hand to my clanker 1 and say: ?understand this, reproduce it, inspect the code, and propose a fix.? That means the shape of the issue matters in a new way. A bad issue was always annoying, but at least a lot of issues were vague. Now we are also dealing with a class of issues that are 5% human and 95% clanker-generated and largely inaccurate shit. A bad issue...

10. Signing is for the bad days

Source: Andrew Nesbitt | Published: 2026-05-24T10:00:00+00:00

Link: <https://nesbitt.io/2026/05/24/signing-is-for-the-bad-days.html>

I have had roughly the same conversation four or five times in the last month. I?m explaining why a registry should adopt Sigstore, or why a build pipeline should emit in-toto attestations, and the person across the table says some version of: we already use TLS to the registry, the registry already hashes the tarballs, the lockfile already pins the hash, what does a signature add? And on a Tuesday afternoon when nothing has gone wrong, the honest answer is that it adds a bit of CPU on publish and a bit of YAML in the workflow and not much else you can see. That answer is also why we keep having supply chain incidents, because a hash in a lockfile tells you the bytes haven?t changed since you locked them; it can?t tell you whether they were ever the right bytes, and the whole point of this class of tooling is to answer that second question. It does nothing visible until the day someone compromises a build server or swaps a tarball on a mirror, and on that day it?s the difference between ?the client refused to install it? and a blog post that starts with the word ?incident?. I want to walk through the three projects that most of this work sits on and what each one actually defends...

11. The Eternal Sloptember

Source: the singularity is nearer | Published: 2026-05-24T00:00:00-07:00

Link: <https://geohot.github.io//blog/jekyll/update/2026/05/24/the-eternal-sloptember.html>

I?m calling it now, the adoption of AI agents into software development will be one of the most costly mistakes in the field?s history. Agents cannot program, and it?s taking longer and longer to realize that they can?t. They are a highly sophisticated statistical model designed to mimic the distribution of programming. The output is broken, but in a way that?s getting harder and harder to detect. Which is exactly what you?d expect from an increasingly accurate statistical model. At first, I rejected this. I bought into the Twitter explanation of status anxiety. I define some of my self worth by my programming abilities, so wouldn?t it make sense to get defensive around that loss? Deny the models can code for as long as I could to preserve my ego? I mean, it?s very clear they can solve math problems I couldn?t hope to solve if I devoted my life to it. So why can?t they program? Maybe I?m just not good enough of a programmer to recognize their genius. I really tried for the last 6 months. I wrote some parts of tinygrad with agents. I reversed a USB PCIe chip with agents. But each time I suspected I could have done it better and faster manually. The agent frontloads all the progress...

12. Why I can't stand the word "driven"

Source: Westenberg. | Published: Mon, 25 May 2026 00:08:34 GMT

Link: <https://www.joanwestenberg.com/why-i-cant-stand-the-word-driven/>

A man named Harry Readford once stole close to 1,000 head of cattle from Bowen Downs station in central Queensland and drove them south, down through the Channel Country and along the Strzelecki Track into South Australia - across a stretch of desert the squatters swore no herd could

13. Childhood Computing

Source: Susam Pal | Published: 2026-05-24T00:00:00Z

Link: <https://susam.net/childhood-computing.html>

I recently stumbled upon a nice blog post titled Childhood Computing . It made me think about my own childhood computing experience. I am much older than the author of the aforementioned post, but like them, I too love computers. I have for most of my life. In 1992, when I was eight years old, my parents decided to transfer me to a new school because of its curriculum. They did not know it then, and it probably did not even matter to them, but this new school had a computer lab. That was quite remarkable for its time. I grew up in a very tiny industrial town. The computers in the lab were hand-me-downs from the silica factory around which the town was built. We got only about two hours of time per month in the computer lab, but the little time I got there opened up a whole new world for me. Before entering the lab, we had to leave our shoes at the door. 'These are expensive machines. We must keep them free of dust', our teacher would say. It was a ritual. The computers were very old IBM PC compatible machines, mostly with monochrome cathode-ray tube (CRT) monitors. They had no hard disks at all. They had a few hundred kilobytes of RAM. Every time, we performed the same ritual. Ins...

14. ICT van levensbelang: kantoorautomatisering is geen leidraad

Source: Bert Hubert's writings | Published: Fri, 14 Feb 2020 09:00:00 +0100

Link: <https://berthub.eu/articles/posts/ict-van-levensbelang/>

Gisteren verscheen het rapport 'Patiëntveiligheid bij ICT-uitval in ziekenhuizen' van de Onderzoeksraad voor veiligheid. Omdat ik een bescheiden bijdrage heb geleverd aan dit rapport voel ik me geroepen een stukje te schrijven over wat in het rapport het 'ICT-fundament' wordt genoemd. Voor de volledige duidelijkheid, wat ik hier schrijf heeft niets te maken met de Onderzoeksraad en ook niet specifiek met de inhoud van het rapport. Zie het als een overdenking over bedrijfskritische ICT.

16. 5G: The outsourced elephant in the room

Source: Bert Hubert's writings | Published: Mon, 20 Jan 2020 15:00:00 +0100

Link: <https://berthub.eu/articles/posts/5g-elephant-in-the-room/>

This article is part of a series on (European) innovation and capabilities. In a break from the usual GPS/Galileo, DNA and C++ posts, here is a bit on 5G and national security. It turns out that through PowerDNS and its parent company Open-Xchange, we know a lot about how large scale European communication service providers work - most of whom are our customers in some way. In addition, in a previous life I worked in national security and because of that I have relevant knowledge of how governments (your own and foreign ones) 'interact' with telecommunication providers.

17. How my minimal, memory-safe Go rsync steers clear of vulnerabilities

Source: Michael Stapelbergs Website | Published: 2026-05-24T16:20:22+02:00

Link: <https://michael.stapelberg.ch/posts/2026-05-24-minimal-memory-safe-go-rsync-vulns/>

Back in January 2025, multiple different security researchers published a total of 6 security vulnerabilities in rsync , some of which allow arbitrary code execution and file leaks, so naturally I was wondering whether/how my gokrazy/rsync implementation was affected. Did implementing my own (compatible, but minimal) rsync in Go, a modern and memory-safe programming language, really rule out entire classes of security vulnerabilities? This deep dive article was in the making since January 2025, but was delayed because we uncovered more unpublished vulnerabilities in the process! The 'Security Vulnerabilities' section now covers all 12 vulnerabilities from the January 2025 batch and the May 2026 batch. If you are running

(upstream, samba) rsync in production, upgrade to version 3.4.3 or newer. If you are running gokrazy/rsync in production, upgrade to version v0.3.3 or newer. Feel free to skip over the nitty-gritty security issue details and jump directly to: The verdict on whether using Go has helped . The verdict on whether a minimal re-implementation like gokrazy/rsync helps . My comparison with OpenBSD's opensync (written in C). Defense in depth mechanisms one can use on Linux...
