Human Agent in the loop I dislike the phrase "human in the loop" because it cedes authority to the machines. Let's flip the narrative. It's our loop, we work the same way we always have, now we recruit agents to join the team. An agent-assisted process need not be a black box that takes in prompts and emits features. [...] Let's do agentic software development like that. Not as a loop we've been excluded from, instead as one we invite agents into. ? Jon Udell , ?Doctor, it hurts when agents create unreviewable PRs.? ?Don't do that.? Tags: jon-udell , coding-agents , generative-ai , agentic-engineering , ai , llms

2. Hack Your Summer

Source: Simon Willison's Weblog | Published: 2026-06-28T19:26:11+00:00

Link: <https://simonwillison.net/2026/Jun/28/hack-your-summer/#atom-everything>

Hack Your Summer I learned about this initiative from DJ Patil this morning: It's a 4-week, high-velocity production sprint for undergraduate students, graduate students, and recent graduates who want to build something real this summer. You'll learn how to identify a project, make steady progress, get support from mentors and peers, and create tangible, public-facing work you can actually show future employers. Hack Your Summer is partly a reaction to the internship crisis facing US college students this year. There are way fewer available internships than usual, as companies have reduced their hiring ambitions and teams have less capacity to coach interns. Hack Your Summer provides an alternative path for the many students who didn't catch one of those rare internships. A second (free) cohort starts on July 13th, and the deadline for students to apply is July 8th. They're also accepting volunteers to help mentor the students. Tags: careers

3. Auth.md ? an Open Protocol for Agent Registration From WorkOS

Source: Daring Fireball | Published: 2026-06-29T01:32:24Z

Link:

https://workos.com/auth-md?utm_source=daringfireball&utm_medium=newsletter&utm_campaign=q22026

My thanks to WorkOS for sponsoring DF last week to promote Auth.md, their new open protocol for AI agent registration. (Who'd have thunk that I'd be getting paid to promote new uses for Markdown 22 years after releasing it ?) Sign-up forms were built for humans in browsers, so how do AI agents programmatically register with services? That's the question Auth.md aims to answer. It's a single Markdown file you host at your domain that tells agents how to register your users, which flows you support, what scopes you expose, and how credentials get issued. It's like robots.txt but for agent registration. Cloudflare, Firecrawl, and Resend have already adopted it. An open protocol authored by WorkOS. Read the spec . ?

4. Daniel Agee: ?Remembering Om?

Source: Daring Fireball | Published: 2026-06-29T01:21:49Z

Link: <https://glass.photo/highlights/remembering-om>

Daniel Agee, an early member of the team at Glass, writing on the Glass blog: It's not lost on us that Om's photography , often taken in frozen lands in or around the arctic circle, was the polar opposite of his personality. While he focused on subtle shapes and hidden landscapes, he was the sun of any group he was in. Folks just naturally fell into his orbit. Agee's lovely piece is replete with photos by Om. A veteran of the internet publishing space, he was one of the first to take the now well-worn path of technology writing into venture capital. When we briefly explored raising a small round of VC funding after our launch to support our growth, Om was our first call. He answered and immediately said, ?I love you guys, I'll invest the money if you want it, but don't fucking do it. What you have is special. Don't fucking ruin it.? That's Om. Simple and to the point. That simplicity showed up in his photography practice.

Strip away everything from a photograph, down to the bare minimum of contrast or shadow. What do you focus on? What do you see? How can something so simple be so fulfilling? That is exactly how Om spoke. Always. To the point. Why waste time? Why mince words? Why...

5. Matt Mullenweg: ?All Roads Lead to Om?

Source: Daring Fireball | Published: 2026-06-29T01:08:13Z

Link: <https://ma.tt/2026/06/om-forever/>

Matt Mullenweg: Fundamentally, Om was a lover of humanity. He became a fast ?regular? everywhere he went. He wouldn?t just buy coffee, he would also learn the name and story of every barista, the dogs and people in South Park. His deep curiosity and respect weren?t just for the fine and famous. It extended to every soul that crossed his path. His encyclopedic knowledge and photographic memory created connections not just in San Francisco, but all around the world wherever we traveled. (I need to pull the stats, but we went to five continents together, including Antarctica.) He loved people and their stories. And: One of the biggest lessons I learned from Om is the deep appreciation of craft. When he took an interest in photography or pens, he would somehow find his way to the most obscure, highest-quality expression of that form. ?What Would Om Want?? is a question I will always ponder. I want to craft products that would make Om proud. If you?re going to get into something, you ought to pursue it to its full extent. If you?re not interested enough to do that, don?t bother getting into it. Find the few things you love; don?t waste your time on the many things you merely like. Matt...

6. The Laziest Generation

Source: Software and Tech stories from an Insider - iDiallo.com | Published: Sun, 28 Jun 2026 07:00:00 GMT

Link: <https://idiallo.com/blog/the-laziest-generation>

I don't understand why this generation can't afford a home. When my grandfather was 18, he had already saved enough money from his paper route and various odd jobs to buy his first home. By the time my father turned 26, he was already married, had his first child, and was moving into his first home. We lived frugally, and our parents taught us the value of spending wisely. Today's man-children, at the ripe old age of 40, still cannot afford a home. Yet they have no problem eating out every day, going to the movies, and buying popcorn and avocado toast. Add in subscriptions to ten different services they barely use, and that's money thrown out the window. They don't see the correlation between their spending habits and their inability to buy a home or save money in the first place. I understand that my grandfather's house only cost \$12,000, and my father bought his for \$50,000. Mine was much more expensive, I paid \$150,000, and that house is now worth a million. I understand that by the time my children are 26, it will probably be worth \$10 million. If they start saving now, they'll have a shot. But I can tell they will choose reckless spending over saving, and I simply do not unde...

7. Go interfaces, reflection, and binary size

Source: Chris's Wiki :: blog | Published: 2026-06-28T02:17:32Z

Link: <https://utcc.utoronto.ca/~cks/space/blog/programming/GoInterfacesReflectAndBinarySize>

Recently an interesting series of commits landed in Prometheus with the goal of reducing the size of the Prometheus binary by allowing the Go linker to remove more unused code (something it's quite good at in general , although the linker is also deliberately limited in this). The commit with the message that's most informative about what is going on and why is `discovery/gce: keep [Google Cloud] Compute SD client from defeating dead-code elimination` , and you can read the full details in it. The short version is that if you're using certain sorts of reflection anywhere in your program, the Go linker won't remove exported (public) methods of any concrete type that's reachable through an interface. It doesn't matter how narrow the interface is (it can be the famous and minimal `fmt.Stringer`); the moment you combine reflection and a concrete type in an interface, the Go linker more or less stops throwing out unused functions and methods. Well, sort of, as the commit explains. Unlike the standard Go toolchain not doing dead code elimination for package level variables with constant values ,

this isn't merely the linker deciding it's too much work to do this dead code elimination
opt...

8. Examining circuit boards from the Space Shuttle's I/O Processor

Source: Ken Shirriff's blog | Published: 2026-06-28T09:11:20.022-07:00

Link: <http://www.righto.com/2026/06/space-shuttle-io-processor-boards.html>

The Space Shuttle's five 1 general-purpose computers played a critical role in each flight: controlling the engines, monitoring thousands of sensors, displaying data to the astronauts, and navigating the Shuttle. Each computer consisted of two 60-pound aluminum-alloy boxes: the box on the right is the CPU, a 32-bit processor that executed 420,000 instructions per second. These computers were designed before microprocessors became popular, so the processor was built from multiple boards crammed with simple chips and they used magnetic core memory rather than DRAM chips. The Space Shuttle IOP and CPU (AP-101B). Photo courtesy of RR Auction . The box on the left is the I/O Processor (IOP): the link between the CPU and the rest of the Shuttle. It implemented the input/output capabilities for the computer, primarily 24 high-speed networks that connected the computer to the Shuttle's systems and sensors. But the IOP wasn't just a peripheral; it was a separate programmable computer, more complicated than the main CPU. The IOP had an unusual architecture: it was one of the first multi-threaded computers, implementing 25 virtual processors (with two completely different instruction sets) t...

9. Writing down harmonic numbers

Source: John D. Cook | Published: Sat, 27 Jun 2026 01:51:03 +0000

Link: <https://www.johndcook.com/blog/2026/06/26/writing-down-harmonic-numbers/>

The n th harmonic number is the sum of the reciprocals of the first n positive integers. $H_n = 1 + 1/2 + 1/3 + 1/4 + \dots + 1/n$ The product of all the denominators is $n!$, so you could write H_n as a fraction $H_n = p/q$ where $p = n!$ H_n is an integer and $q = n!$. While [?] The post Writing down harmonic numbers first appeared on John D. Cook .

10. Book Review: The Hotel Avocado by Bob Mortimer ?????

Source: Terence Eden's Blog | Published: Sun, 28 Jun 2026 11:34:45 +0000

Link: <https://shkspr.mobi/blog/2026/06/book-review-the-hotel-avocado-by-bob-mortimer/>

Despite vowing not to read sequels of books I love, I'm constantly surprised that regression to the mean is an iron-clad law of the universe. I thoroughly enjoyed the first book in the series, so eagerly gobbled up the second. What a burlap fool I am. What was charming and wry in The Satsuma Complex is now overdone and clichéd. The violence, which was an undercurrent in the first book, is now ?

11. Review: Gamrombo PS5 controller - including Linux set up ?????

Source: Terence Eden's Blog | Published: Fri, 26 Jun 2026 11:34:42 +0000

Link: <https://shkspr.mobi/blog/2026/06/review-gamrombo-ps5-controller-including-linux-set-up/>

I'm not paying seventy bloody quid for an official PS5 controller - so I found a knock-off version for a smidge under £40. And this one has lots of unnecessary blinkenlights! Gamrombo is the consumer-facing brand of the generically named Professional Controller Manufacturer. AKA "Huizhou Ronghui Technology Co., Ltd" - there's virtually no information about them online other than paid-for ?

12. Working around dragons with the Lemote Yeeloong laptop and OpenBSD

Source: Old Vintage Computing Research | Published: 2026-06-27T20:08:45.674-07:00

Link: <https://oldvcr.blogspot.com/2026/06/working-around-dragons-with-lemote.html>

Behold: the Guru of GNU ! (Photo by Habib Mhenni, Wikimedia Commons, CC BY-SA 3.0.) True enlightenment only comes from a truly free computing experience, probably! And while there is no nerd who lacks an opinion on Richard Stallman personally, likewise let none claim he does not practice what he preaches. Why, the very laptop in front of him was selected deliberately because it can operate with no binary blobs and no firmware you couldn't examine or replace with your own, and runs his choice of fully libre operating systems. The fact it has a Chinese

MIPS64 derivative in it was undoubtedly just more compound on the heat spreader. Now, in my case, the fact that it is a MIPS-family system meant I certainly needed one in my unusual laptop collection. And since it can run OpenBSD it seemed like a good way to get nerdsniped in two ways by one computer: since I mostly run NetBSD as my BSD and server operating system of choice, I figured this was also a good way to learn OpenBSD on a highly portable netbook using an unusual platform. As usual, of course, the whole shooting match turned out to be a much longer journey than I'd anticipated, and my typical insistence on deviating from...
