Source: Simon Willison's Weblog | Published: 2026-06-23T21:34:37+00:00

Link: <https://simonwillison.net/2026/Jun/23/datasette/#atom-everything>

Release: datasette 1.0a35 I'll write more about this one tomorrow, but it's a big release.

Three highlights from the release notes: New "Create table" interface in the database actions menu, backed by the `//-create` JSON API. It can define columns, primary keys, custom column types, NOT NULL constraints, literal defaults, expression defaults and single-column foreign keys. (#2787) New "Alter table" table action and `//-alter` JSON API for changing existing tables: add, rename, reorder and drop columns; change column types, defaults, NOT NULL constraints, primary keys and foreign keys; and rename the table. The alter table dialog also includes a "Drop table" button. (#2788) New Template context documentation listing the variables available to custom templates for Datasette's core pages. Variables documented there are treated as a stable API for custom templates until Datasette 2.0. The documentation is generated from dataclass definitions next to the view code, with tests that compare the documented fields against the actual contexts rendered by the database, table, query and row pages. (#1510 , #2127 , #1477 , #2803) Here's a rough video demo I made of the new create/alt...

2. OPFS + Pyodide test harness

Source: Simon Willison's Weblog | Published: 2026-06-23T18:58:54+00:00

Link: <https://simonwillison.net/2026/Jun/23/opfs-pyodide/#atom-everything>

Tool: OPFS + Pyodide test harness I've been pondering if Datasette Lite - the Python Datasette application run entirely in the browser using Pyodide and WebAssembly - might be able to edit persistent SQLite files stored on the user's computer. That's what OPFS (Origin Private File System) is for, so I had Claude Code for web build me this playground UI to try it out in different browsers. Tags: browsers , pyodide , datasette-lite

3. Scattered Spider Hackers Plead Guilty on Day 1 of Trial

Source: Krebs on Security | Published: Tue, 23 Jun 2026 16:12:49 +0000

Link:

<https://krebsonsecurity.com/2026/06/scattered-spider-hackers-plead-guilty-on-day-1-of-trial/>

Two men pleaded guilty in the United Kingdom this week to criminal charges stemming from an August 2024 cyberattack that crippled Transport for London, the entity responsible for the public transport network in the Greater London area. The duo were key members of a prolific cybercrime group known as Scattered Spider, and their guilty pleas came on the first day of what was expected to be a six-week trial.

30-disc set includes: 4K restorations of Kubrick's thirteen features and three shorts, with their original soundtracks alongside the 5.1 mixes, restored and remastered Over twenty-five

hours of interviews, documentaries, and behind-the-scenes materials Kubrick's international version of The Shining A new 4K restoration of Vivian Kubrick's behind-the-scenes documentary Making 'The Shining' Newly recorded commentary tracks featuring filmmaker Lee Unkrich (editor of the book Stanley Kubrick's 'The Shining') and author Michael Benson (Space Odyssey: Stanley Kubrick, Arthur C. Clarke, and the Making of a Masterpiece) All work and no play makes Jack a dull boy. ?

6. Dickover of the Week: The Observer

Source: Daring Fireball | Published: 2026-06-22T17:12:42Z

Link: <https://bvsveera.net/observer-dickover/>

Bharat Iyer: Let's be real ? if The Observer actually cared at all about your privacy, they wouldn't share your personal data with ONE HUNDRED AND SIXTY ONE FUCKING PARTNERS. [...] Imagine if, upon purchasing a copy of the Sunday newspaper in 1791 , you were followed around town by 161 men, taking note of everything you do throughout the day. Makes you wonder who's really doing the observing. It's bad enough to include 161 third-party trackers on a website. But it's downright dystopic to declare your 161 third-party 'partners' under the heading 'We Care About Your Privacy'. That's like beating someone in the head with a baseball bat while telling them 'We care about your skull', literally adding insult to injury. Yours truly back in 2020, ' Online Privacy Should Be Modeled on Real-World Privacy ': Imagine if you were out shopping, went into a drug store, examined a few bottles of sunscreen, but left the store without purchasing anything. And then immediately a stranger approached you with an offer for sunscreen. Such an encounter would trigger a fight or flight reaction ? the needle on your innate creepometer would shoot right into the red. (Not to mention that if real-world track...

7. The Coming Loop

Source: Armin Ronacher's Thoughts and Writings | Published: 2026-06-23T00:00:00+00:00

Link: <https://lucumr.pocoo.org/2026/6/23/the-coming-loop/>

I don't prompt Claude anymore. I have loops running that prompt Claude and figuring out what to do. My job is to write loops. ? Boris Cherny Over the last months I have watched more and more people build something on top of coding agents that feels meaningfully different from just using a coding agent. Some of this happens on top of Pi which is cool to see for sure! The pattern is the same everywhere though: work is put into a queue of sorts, a machine picks it up, attempts it, stops, and then some harness decides whether that was actually the end. If not, the harness continues the same session, injects another message, starts a fresh session with modified context, or sends the task to another machine. The task stays alive beyond the point where the model by itself would normally have said: 'I am done.' I think about that type of loop more than I want to admit. There is already an agent loop inside every coding agent. The model calls a tool, incorporates the result, calls another tool, reads a file, edits a file, runs tests, and eventually produces some answer. That loop is one we have been quite familiar with for a long time. The other loop is the harness level loop: the loop out...

8. The worthlessness of vitamin D is mildly exaggerated

Source: DYNAMIGHT | Published: 2026-06-23T00:00:00+00:00

Link: <https://dynamight.net/vitamin-d/>

For a while there, many people thought vitamin D was magical?that it could improve bones, the heart, infections, cancer, heart disease, longevity, even mental health. But among people I respect, opinion is now overwhelmingly that taking vitamin D does nothing unless you're severely deficient. The central argument is that while vitamin D levels are correlated with ~all positive health outcomes, when you actually test vitamin D supplements against placebo in randomized trials, nothing ever happens. That's what I used to think, too. But I've come to think the skeptics have over-corrected. Yes, randomized trials have shown the magical correlations are not causal. But if you start with non-insane expectations, the trials look like weak but positive evidence. And if you consider what we know about biology and evolution, I think the balance of evidence tips pretty clearly in the direction that people with low-ish levels would be wise to supplement. Am I certain that vitamin D is beneficial for people with

low-ish levels? Absolutely not! But I claim that's the best bet given the limits of our knowledge. The classical view: Boring bone vitamin Most vitamins are 'ingredients' that the body...

9. Arp 293: More interacting galaxies

Source: Maurycy's Blog | Published: Tue, 23 Jun 2026 00:00:00 +0000

Link: <https://maurycyz.com/astro/arp293/>

North is right. 0.52"/pixel (18'x9' field) FWHM=4.5" The pair of galaxies near the center is NGC 6285 (top) and NGC 6286 (bottom). The lower one has a distinct tidal trail below it, and a faint bridge to the upper galaxy is visible. Both sit around $z=0.018$. The edge on galaxy is UGC 10641, and sits at a similar redshift to the pair at $z=0.018$, indicating that this is probably a group of three gravitationally bound galaxies. My field also included a galaxy cluster around 16h57m49s +58°46'55": The brightest member, LEDA 2582489 has a redshift of around $z=0.11$, which puts it at a comoving distance of 1.5 Gly, way beyond the main target of the photo. Total exposure time: 341 * 30 seconds = 2.8 hours. Telescope: C9.25 (230mm, f/10, fl=2300mm) + 0.63 Starizona reducer Camera: IMX533 (16mm diagonal, square, color) Processing: Calibration (dark + flat) Stacking (average w/ outlier rejection) White balance and background subtraction (no gradient removal) Asinh stretch (color preserving) It looks like my guiding got messed up after the meridian flip, resulting in some annoying walking noise. If the when the telescope is drifting, stacking will smear out the sensor's pattern noise into diagonals...

10. Regular expressions that work 'everywhere'

Source: John D. Cook | Published: Wed, 24 Jun 2026 00:26:11 +0000

Link: <https://www.johndcook.com/blog/2026/06/23/regex-everywhere/>

The most frustrating aspect of regular expressions is that implementations vary. Features supported in one tool may not be supported at all in another tool, or they may be supported with slightly different syntax. I learned regular expressions in the context Perl, a maximalist regex environment. This led to frustration when features I expect to [?] The post Regular expressions that work 'everywhere' first appeared on John D. Cook .

11. The quiet issue of lurking settings (and how it bit me)

Source: Chris's Wiki :: blog | Published: 2026-06-23T02:31:35Z

Link: <https://utcc.utoronto.ca/~cks/space/blog/sysadmin/LurkingSettings>

Recently I wrote an entry about a simple but difficult wish I had for a certain sort of terminal pager that handled emoji . In comments, people suggested that the venerable less would do what I wanted, which was something I'd already tried and discovered it had behavior I didn't want. Except, well, let me quote my eventual comment: It turns out that my testing of less's behavior was being contaminated by my usual \$LESS settings, and I think that 'less -XRn' does more or less what I want (I was being fooled partly because my usual \$LESS includes 'c', well, technically 'C'). I've been using less for a long time and for most of that time I've had the same set of less settings, burned into a \$LESS environment variable set in my dotfiles, and also the same set of alternate less key bindings (where N and P move through files instead of their normal actions). I had long since forgotten the specifics of my \$LESS settings when I tested less ; my settings were just how less worked. And so I was fooled into initially thinking that less didn't work for what I wanted. (I remember N and P partly because when I use less as root or on a machine I haven't particularly set up my account on, I don't...

12. Sunsetting a Package Manager

Source: Andrew Nesbitt | Published: 2026-06-23T10:00:00+00:00

Link: <https://nesbitt.io/2026/06/23/sunsetting-a-package-manager.html>

On December 2nd 2026, CocoaPods trunk goes read-only . Orta Therox set the plan out in 2024: the server stops accepting new pods and new versions, while the more than 100,000 libraries already published keep resolving through the Specs repo on GitHub and the CDN on jsDelivr, so every existing Podfile resolves exactly as it did the day before. The maintainers had run out of people, Apple's Swift Package Manager had become the first-class tool, and a 2024 round of

critical vulnerabilities had turned running the trunk server into a liability. Plenty of users remain: React Native still resolves its iOS dependencies through CocoaPods, the move to SPM is an active RFC rather than a finished path, and a long tail of apps will keep running pod install well after the freeze. A registry that stops accepting uploads still serves installs to everyone who already depends on it, and the CocoaPods maintainers are not the first team to manage that. Four registries have frozen or shut down before them: Bower , web and JavaScript, 2017 Bintray , JFrog's binary host, May 2021 JCenter , Java and Android, read-only May 2021, redirected August 2024 Atom apm , Atom editor packages, December 2022 Degrees...

14. Liminality

Source: the singularity is nearer | Published: 2026-06-23T00:00:00-07:00

Link: <https://geohot.github.io//blog/jekyll/update/2026/06/23/liminality.html>

It's crazy how much Fullmetal Alchemist mimics how AI is playing out. We pour human souls into a philosopher's stone that we think will solve all our problems and cure death. It doesn't exactly do this, but you can use it to create homunculi that behave like people, Chat, Claude, GLM. The homunculus is a puree of the souls that were used to create it. It's easy to rage against the bubble and the hype, but unlike previous bubbles that isn't really the problem. All marketing and frame aside, the problem is the AI itself. It demoralizes you without being better than you ? not because the current AI is good, but because the next one will be so much better. And while maybe I wish it wasn't like that, I don't think it's wrong. And I don't really wish it wasn't like that, may you live in exciting times and all that. This has been my dream for years ? even these feelings aren't new, when I read Yudkowsky at 15 I became really depressed, I started failing at school, computers would be able to do everything better than us. But then I realized computers couldn't do these things yet. They still can't. But it feels close. I don't think it always felt close? 1e25, 1e26, 1e27?is it just this sim...

15. Tagged data in Haskell (SICP 2.4.2)

Source: Entropic Thoughts | Published: Tue, 23 Jun 2026 00:00:00 +0200

Link: <https://entropicthoughts.com/sicp-2-4-tagged-data-in-haskell>

I have a copy of SICP, or as it is also known, The Wizard Book . This book is widely praised, but I can't take the time to work my way through all of it. However, sometimes I jump into parts of it that look interesting. Today, we'll see how to support multiple representations of data through tagging. This article is written in Haskell throughout, but at the start it will look a lot like the Lisp code in SICP. I have intentionally tried to recreate the SICP solution as closely as possible, including dynamic typing and all. See the appendix if you're curious how it works. Complex numbers can be stored in their rectangular form, where there's a real and an imaginary part. They can also be stored in polar form, where there's a magnitude and an angle. The authors ask us to imagine that two people have been working on a library for mathematics, but ended up choosing different ways to store complex numbers. How can they write their code so that they don't have to agree on one way to store the data? (Continue reading the full article on the web.)

16. Our hydro deserves better than a chatbot

Source: Dr Paris Buttfield-Addison | Published: Tue, 23 Jun 2026 00:00:00 +0000

Link: <https://hey.paris/posts/ai-data-centres-tasmania/>

Last week, the Tasmanian Greens announced they'll move for an urgent parliamentary inquiry into the AI data centres going up across the north of the state. I think this is a very good idea. These projects appear to have been approved without any specific regulations or parliamentary

oversight, and the public has barely had the chance to have a say. The announcement also put a new number on the record: in Budget Estimates, under Greens questioning, Energy Minister Nick Duigan confirmed Firmus plans to draw 400 to 500 MW across two or three ?AI factory? sites , which is more than Bell Bay Aluminium?s 335 MW , currently the state?s single biggest power user.

19. How we?ll fight the platform war against Big AI

Source: Anil Dash | Published: 2026-06-23T00:00:00Z

Link: <https://anildash.com/2026/06/23/fight-ai-platform-war/>

One aspect of strategy that?s been largely lost in the tech industry in recent years is how to compete against platforms, since the major tech companies have gotten so big that markets are no longer competitive. However, the AI market is still early enough, and users and society are still angry enough, that the Big AI companies can lose. But for them to lose, everybody else in the ecosystem has to carry out the nearly-lost art of platform strategy . Tech companies (and even open source communities!) used to carry out these tactics in emerging product categories ranging from desktop office suites to operating systems to web browsers, though over the decades, the lesson that big tech learned was, basically, that they should play dirty. You win platform strategy battles through power and persuasion. We're going to get both. Historically, we would have relied on regulators or media to help hold bad actors in the tech space accountable, but in the United States, these entities are largely not going to help very much. Some state and local governments may assist, and some independent journalists or smaller media outlets are pushing for accountability, but the most powerful entities are e...
