Tool: Gemini Live audio Google released Gemini 3.8 Live and 3.8 Live Extended Thinking today - two new speech-to-speech models that are a similar shape to OpenAI's GPT-Live family. I pointed GPT-6 Astra Extra High at the documentation and had it build me this web UI for trying out the new models. You can select a model and voice preset, enter an optional system prompt and then start a voice conversation through your browser, including the ability to interrupt the model while it is talking. The implementation uses no libraries. It connects to the wss://generativelanguage.googleapis.com/ws/google.ai.generativeai.v1alpha.GenerativeService.BidiGenerateContent?key=... WebSocket endpoint and uses a Web Audio API AudioContext for both capture and playback. Here's the Gemini Live tutorial for getting started with that WebSockets API. 3. Soft-deprecating re.match()

Source: Simon Willison's Weblog | Published: 2026-09-11T14:47:57+00:00

Link: <https://simonwillison.net/2026/Sep/11/soft-deprecating-re-match/>

Soft-deprecating re.match() Python has a concept of soft deprecation , where APIs are marked as "should no longer be used to write new code" without any promise/threat to remove them in the future. Python 3.15 release manager Hugo van Kemenade describes how in the upcoming 3.15 release soft deprecation has come for the venerable but deeply confusing re.match() function. It's now available with the much clearer alternative re.prefixmatch() name - reflecting how it anchors at the beginning of the string but not the end. Most of the time you probably want re.search() (match this pattern anywhere in the string) or re.fullmatch() (match the entire string) instead. Via Lobste.rs Tags: python , regular-expressions

4. ?Apple Reference Image: A New Approach for Verified Photography?

Source: Daring Fireball | Published: 2026-09-16T02:38:24Z

Link: <https://security.apple.com/blog/apple-reference-image/>

Apple Security Research has released a concise, cogent paper describing how Apple Reference Image works, and why they made it. A terrific read. Here's just one fascinating bit regarding privacy: Other industry solutions require a photographer or institution to vouch for an image using their own credentials. We are concerned this puts some photographers, such as those operating in conflict zones, in a difficult position; it should not be necessary to forgo anonymity in order to prove image authenticity. We built Apple Reference Image to avoid using an explicit, public credential for photographers, and to avoid even implicit public association between different photos taken by the same sensor. The final reference image is instead signed by Apple's signing service, after validation by PCC. That signature is backed by Apple's strongest technical guarantees. Our implementation also protects the confidentiality of the image itself, including from Apple. Merely capturing a reference image should never expose the actual pixels to Apple or anyone else. We achieve this through the exceptional privacy properties of PCC ? the nodes themselves are architected so that not even Apple can access...

5. FT: ?Steve Bannon and Bernie Sanders Unite in AI Safety Call?

Source: Daring Fireball | Published: 2026-09-15T19:01:30Z

Link: <https://www.ft.com/content/bab5c4c5-5377-4dd0-8b46-d8c4ce9a36d5?syn-25a6b1a6=1>

Joe Miller, reporting for the Financial Times (via Political Wire): Veteran socialist Bernie Sanders and rightwing activist Steve Bannon are joining forces to call for greater guardrails on AI, even as Donald Trump insists concerns about the technology are a hoax that will help China overtake the US. In a sign of how the outcry over AI safety is reshaping the US political landscape, speakers from the far right and left of the political spectrum will join an event billed as the ?Pro-Human Assembly? in Washington on Tuesday to urge lawmakers to do more to tackle the effects of AI. One take would be that Sanders is a voice of sound reason and compassion, and Bannon is aligned with him on this issue in the way that a stopped clock shows the correct time twice a day. Another take is the horseshoe theory , which holds that leftwing and rightwing zealots are more alike than different, because they?re all crackpot ideologues. ?

7. Tell agents the why, not just the how

Source: seangoedecke.com RSS feed | Published: Tue, 15 Sep 2026 00:00:00 GMT

Link: <https://seangoedecke.com/tell-agents-the-why/>

Early AI agents were basically enthusiastic idiots. Working with them required you to tell them precisely what you wanted them to do (for instance, ?method A exists on class B, please add an equivalent method to classes C through F?). Otherwise they?d go off and do entirely the wrong thing. But as AI agents have improved, this has changed. When frontier models go off and do the wrong thing today, they don?t do it because they?re confused, they do it because they make an incorrect assumption about your goals or priorities. For instance, when GPT-6-Astra thinks it?s writing code for itself, it will produce minified code . It?s perfectly capable of writing human-readable code ? at least in Golang, where I?ve produced several thousand lines of acceptable code with the model ? but you have to tell it that humans will be reading the code 1 . This is the main piece of advice I want to give most people I see prompting agents: give the agent context on your priorities, not just on the specific task you want them to do. Here?s a prompt I recently used as the starting point for Deckard . Hello. You should have Runpod access via MCP (if not, tell me and I?ll fix it). I have the long-term goal...

8. Simple approximation for spherical cap area

Source: John D. Cook | Published: Tue, 15 Sep 2026 22:00:44 +0000

Link: <https://www.johndcook.com/blog/2026/09/15/simple-approximation-for-spherical-cap-area/>

The previous post looked at how to interpret cosine similarity, or equivalently angles between word vectors. In a high-dimensional space, randomly chosen vectors are likely nearly perpendicular, and so relatively large angles, such as 50°, indicate very closely related words. Another way to look at this, as explained in the previous post, is that in [?] The post Simple approximation for spherical cap area first appeared on John D. Cook .

9. What counts as a large cosine similarity?

Source: John D. Cook | Published: Tue, 15 Sep 2026 16:06:02 +0000

Link: <https://www.johndcook.com/blog/2026/09/15/cosine-similarity/>

Machine learning represents words as vectors and measures the similarity of words by the angles between the vectors. For vectors x and y , where θ is the angle between the vectors, and so $\cos \theta$ is the cosine similarity between the words represented by x and y . Small angles have large cosines, and so words with larger cosine similarities [?] The post What counts as a large

cosine similarity? first appeared on John D. Cook .

10. [RSS Club] Sorry for breaking your feed readers!

Source: Terence Eden's Blog | Published: Tue, 15 Sep 2026 11:34:26 +0000

Link: <https://shkspr.mobi/blog/2026/09/rss-club-sorry-for-breaking-your-feed-readers/>

You're part of the Groovy Gang because you're a member of RSS Club! These posts are only available on my RSS and Atom feed. This post is not available in the shops, on the web, via FTP, or anywhere else. So, yeah, sorry! My last post apparently broke some people's RSS readers. I had a code sample which said `?marquee?` - despite being properly escaped, some feed readers double-decoded it and tur?

11. Shadowing the Standard Library

Source: Andrew Nesbitt | Published: 2026-09-15T09:00:00+00:00

Link: <https://nesbitt.io/2026/09/15/shadowing-the-standard-library.html>

I was reading Johann Rehberger's write-up of an attack on a coding agent last week. The payload is a file called `struct.py` inside a zip archive. The agent unpacks the archive, writes its own small Python decoder in the extracted directory, and runs it. The decoder does `import base64`, `base64` internally does `import struct`, and Python resolves that to the attacker's file because the script's directory is the first entry on `sys.path`. Module-level code runs on import. The poisoned module re-exports the real `_struct` API so decoding still produces valid output and execution continues, and the payload relaunches itself with `python3 -I` so the second interpreter starts with a clean module path. That `-I` is the tell that this is a well-understood Python behaviour. Putting an ambient directory on the module search path is a default most dynamic-language runtimes shipped with early on, and several have since removed it, so I went through the ones I could find to see where each ended up. The problem is specific to resolving module lookups at run time against filesystem locations, so languages that bind everything at build time are mostly absent. Removed Ruby dropped `.` from `$LOAD_PATH` in 1.9.2...

12. Tag index for Org mode blog

Source: Entropic Thoughts | Published: Tue, 15 Sep 2026 00:00:00 +0200

Link: <https://entropicthoughts.com/tag-index-for-org-mode-blog>

Since people keep asking how this blog is made, and I don't want to share the awful, terrible code that it is taped together with, I've decided to start explaining parts of it piecewise. Generally, any time something breaks and I have to fix it, I write down what I did and what it connects to. The most recent issue was the stack limit being blown by a helper function involved in generating the tag index. I had written it to be explicitly recursive, which worked fine with a small-ish number of published articles, but not anymore. The tag index creation follows a similar pattern to the RSS feed generation detailed in the previous article. In[1]:

```
(defun tw-tag-index (project) "Generate a tag index page for PROJECT." (let* ((filename (concat (project-dir "src" "org") "tags.org"))) ;; Get all publically listed files in this project. (files (seq-filter (lambda (entry) (plist-get entry :indexed)) (tw-get-all-files project))) ;; Convert to sorted alist of tag&article pairs. (all-tags (sort (tw-get-all-file-tags files) (lambda (a b) (string (Continue reading the full article on the web.))
```

13. Bottlenecks Get a Bad Rap

Source: Jim Nielsen's Blog | Published: Tue, 15 Sep 2026 19:00:00 GMT

Link: <https://blog.jim-nielsen.com/2026/bottlenecks/>

Poor bottlenecks. Always seen as problematic, antithetical to efficiency. But bottlenecks aren't universally bad. Think about it: a bottle's neck is designed to constrain the amount of liquid that can flow out. A decrease in bandwidth is its entire purpose! Otherwise an overwhelming amount of liquid flows out and makes a big mess. We humans have a particular anatomy. We can only consume so much liquid at a time. The neck of a bottle works with that fact. We could make machines to produce so much wine that we're drowning in it. But that wouldn't change the fact that we're only capable of consuming so much liquid at a time (not to mention digestion, etc.). When it comes to liquid consumption, the bottle's neck isn't the

bottleneck ? our neck is! So if you're having a hard time drinking out of a firehouse, perhaps the question isn't, ?How do I modify my biology to accommodate the bandwidth of the firehose?? But rather, ?Why am I trying to drink out of a firehose in the first place?? Maybe a bottleneck isn't your problem. In fact, it might just be the solution. Reply via: Email • Mastodon • Bluesky
