I've been following WisdPi's development of various 5 Gbps and 10 Gbps Ethernet adapters for the past couple years. They use newer Realtek Ethernet chips, which sometimes have performance quirks?most frequently encountered under Linux. In today's video, I tested the new WisdPi 10G Ethernet Expansion Card for Framework computers. It fits in any available Framework Expansion slot?even on the Framework Desktop. But Expansion Cards use USB-C for their connection to the mainboard?and therein lies the rub...

simonw/browser-compat-db Inspired by Mozilla's new MDN MCP service - source code here - I decided to try converting their comprehensive mdn/browser-compat-data repository full of browser compatibility data into a SQLite database. This new GitHub Repo includes a Claude Code for web (Opus 4.8) generated script for doing that using sqlite-utils . I wanted the resulting ~66MB SQLite database to be available via the GitHub CDN with open CORS headers. GitHub releases don't have those, but any file stored in a regular GitHub repository does - so I had Codex Desktop (GPT-5.5) build a GitHub Actions workflow that builds the database and then force-pushes it to a db "orphan" branch. You can download the resulting database from here , and since it's hosted with open CORS headers you can also explore it with Datasette Lite .

In the last few months, I've started to see [job applications] that were clearly cowritten by an LLM, link to an LLM-generated portfolio site, which then links to LLM-generated GitHub projects, with purely LLM-generated commit messages. [...] My other reaction is that I don't know anything about these people . They haven't put themselves out there. They haven't said anything true. [...] The perfected, generated, prompted resume is generic and impersonal. It tells me nothing about this person, other than that they use particular tools. ? 5. WebKit Always Enables the Copy Menu Item in Every App

Jeff Johnson: Several weeks ago, John Gruber of Daring Fireball asked me whether I could reproduce an issue he was seeing in Safari: when a web page is focused, the Copy menu item in the main menu is always enabled, regardless of whether there's anything selected in the web page. I could indeed reproduce that issue, and it turns out to be the fault of WebKit. The issue also occurs in Mail app, when an email message is focused. On Apple platforms, WebKit is a public API, used by third-party apps in addition to Apple's first-party apps. RSS readers such as NetNewsWire and Vienna , preferred by Gruber and myself, respectively, use WebKit to

display articles from RSS feeds. And sure enough, both apps exhibit the same issue: the Copy menu item is always enabled when an article is focused. What happens if you copy and paste from a WebKit WebView with no selection? Nothing happens, nothing is pasted. However, technically speaking, the clipboard is not empty. In most Mac apps, since the dawn of time, if there is nothing selected to be copied, the Edit ? Copy (and Cut) commands are disabled. If you invoke the ?C shortcut while the Copy command is disabled, you hear an alert sound, letting...

6. WebKit in Safari 27 Beta

WebKit (back during WWDC): If you look through the lists of features and fixes in Safari 27, you'll notice that, although there are 58 brand-new features and 525 fixes ? the largest pile of fixes in any Safari release in recent memory ? most of what is released is not about new things. Most of this work has been about existing features behaving more correctly, handling more edge cases, and fitting together with other features the way you'd expect. We committed our time to increasing quality ? that's the story of this release and the year that led to it. [...] If something has been bothering you, test it in Safari 27 beta. You might be pleasantly surprised. And if it hasn't been fixed yet, file a bug report , or add a comment to an existing issue with a concrete scenario, a link to a real site, or a reduced test case. The more concrete the problem, the more helpful it is. Sounds like it's a bit of a Snow Leopard year for WebKit, too, not just the OSes. ?

7. [Sponsor] WorkOS: Agents Need Auth. There's Now a Spec for It.

When an AI agent tries to complete a task that requires a new account, it hits a wall: the sign-up form. There's no standard for how an agent registers a user with an app on their behalf. auth.md is a file you host at your domain that tells agents how to register your users, which flows you support, what scopes you expose, and how credentials get issued. Think robots.txt, but for agent registration. It composes existing OAuth standards. Cloudflare, Firecrawl, and Resend have already adopted it. An open protocol authored by WorkOS. Read the spec . ?

8. Two versions of a 'is SSH up on a machine' check

Source: Chris's Wiki :: blog | Published: 2026-06-24T02:20:41Z

Link: <https://utcc.utoronto.ca/~cks/space/blog/sysadmin/SshupTwoVersions>

One of my standard little scripts is something I call sshup , which waits for a machine to be 'up' by periodically checking to see if its SSH port is responding. As mentioned in my original entry on sshup , I actually have two versions of this script and recently I discovered that the difference is quietly important. One version of the script uses Netcat, on our Ubuntu machines. The specific Netcat command line it uses is: nc -w3 -q3 -z "\$1" ssh >/dev/null 2>&1 (I didn't used to need the redirection, but Debian reverted a patch and Ubuntu 24.04 picked up the change .) The technical effect of this is to try to connect to the SSH TCP port and exit once it's done that (or been rejected or timed out), with an appropriate exit status. The other version doesn't use Netcat, but in Netcat terms what it does is the equivalent of: nc -N "\$1" ssh /dev/null >2&1 The technical effect of this is to try to connect to the server (if possible), immediately shut down the sending side of the TCP conversation, and wait until the server closes the connection completely. If the server is working properly, these two versions have the same result. But if the server isn't working, the answer these give is...

9. "No way to prevent this" say users of only language where this regularly happens

Source: Xe Iaso's blog | Published: Wed, 24 Jun 2026 00:00:00 GMT

In the hours following the release of CVE-2026-55200 for the project libssh2 , site reliability

workers and systems administrators scrambled to desperately rebuild and patch all their systems to fix an out-of-bounds write in `ssh2_transport_read()` due to a missing upper bound check on the `packet_length` field, resulting in heap corruption and potential remote code execution. This is due to the affected components being written in C, the only programming language where these vulnerabilities regularly happen. "This was a terrible tragedy, but sometimes these things just happen and there's nothing anyone can do to stop them," said programmer Mr. Alex Doyle, echoing statements expressed by hundreds of thousands of programmers who use the only language where 90% of the world's memory safety vulnerabilities have occurred in the last 50 years, and whose projects are 20 times more likely to have security vulnerabilities. "It's a shame, but what can we do? There really isn't anything we can do to prevent memory safety vulnerabilities from happening if the programmer doesn't want to write their code in a robust manner." At press time, users of the only programming language in the world where...

10. I taught a bucket to speak git

Source: Xe Iaso's blog | Published: Tue, 23 Jun 2026 00:00:00 GMT

What happens if I just point a git server at an object storage bucket? Back when I was porting agent sandboxes to Go, I built everything on top of billy, a filesystem abstraction for Go. The whole trick of the project was teaching a Tigris bucket to act enough like a filesystem that a shell interpreter and its tools couldn't tell the difference. Billy was the key layer that made the entire façade fall into place. After I had gotten things working, I learned that I'm using billy way outside its normal usecase. It was originally made for go-git, a pure-Go implementation of git's protocols and data formats. It doesn't rely on the `/usr/bin/git` binary existing at all. Every method on billy's filesystem interface exists purely because go-git needs it. This gave me a terrible idea: I already have a bucket that can quack like a filesystem and go-git's native language is ?filesystem?. Can this Just Work?? Let's find out. Git was always an object store. If you strip away the porcelain, a git repository is 4 basic things: Objects, or compressed blobs of data. Most of the objects in any individual repository are files. Trees, or objects that map to other objects. TL;DR: trees are folders. C...

11. Auth0 PHP - manually authenticating JWT idTokens

I find it baffling just how poorly documented most big projects are. Auth0 by Okta has a fair bit of cash, lots of customers, and almost completely absent documentation. Here's how to successfully authenticate a JWT supplied by Auth0. Once your user has authenticated with Auth0, they will be given an `accessToken` and an `idToken`. Only the `idToken` is needed for our purposes. It will look?

12. Thoughts on Role Confusion

Source: Giles' blog | Published: Wed, 24 Jun 2026 20:15:00 +0000

Link: <https://www.gilesthomas.com/2026/06/role-confusion>

The other day, I came across " Prompt Injection as Role Confusion " (via Simon Willison). It's a really interesting blog-style version of a paper by Charles Ye, Jasmine Cui and Dylan Hadfield-Menell, where they find that LLMs seem to almost ignore 'role' tags like , or , and instead use the tone of text to infer roles. This seems to explain a lot of jailbreaks. The paper When LLMs are reasoning about their context to work out what tokens they need to generate next, they need to separate out different things: what the system prompt says, what the user says, what the LLM itself has said in the past -- and for recent LLMs, what their own past thoughts have been -- their reasoning traces -- and what they've sent to and received from their tools. These "roles" for each bit of text need to be specified in the context. For example, in a simple chatbot (say, 2022-vintage), it might be written up a bit like a transcript : The following is a transcript of a conversation between a user, "User", and an AI bot, "Bot". The bot is helpful and friendly. User: What is the capital of France? Bot: The LLM then starts predicting what would come next (eg. "The capital of France is Paris").

13. Blogging Can Just Be Stating The Obvious

John Gruber writes about those annoying popups every website seems to have now and while he does a great job tearing into these ubiquitous, user-hostile patterns, one of the things that stood out to me about his piece was this meta commentary on blogging. Here's John: If you visit a website you should ... see the website . See its content. Be able to read the article whose page you are attempting to visit. Showing a "subscribe to our newsletter" or "accept our fucking cookies" dickover to someone trying to read an article on the web makes no more sense than sending out an email newsletter that only contains a link to read the newsletter on a webpage. A webpage should show the webpage. An email should show the email. I should not have to explain this. It's funny how often blogging feels like being the little child in the story of The Emperor's New Clothes . You're just stating what seems obvious to you. I often look at my own posts and think, "There's nothing novel, or important, or deep in here at all ? is this even worth saying?" A post's point can seem so glaringly obvious to me (and thus, I presume, others) it feels like a waste of time to even say it. As John says: A webpage s...

14. How to Write an Effective Software Design Document

Source: Refactoring English | Published: Wed, 24 Jun 2026 00:00:00 +0000

A good design doc can save you years of development time. Writing a design doc forces you to think through important decisions before you waste time on the wrong implementation or paint yourself into a corner. It's also the best way to coordinate design decisions among teammates and partner teams. I've written design docs as a developer at Google, Microsoft, and within my own companies . The specifics vary, but the underlying principles remain the same. A design doc should articulate the hard problems you're solving and help your teammates give you feedback.
