Open Source AI Gap Map Current AI is "a global partnership building a public option for AI", founded as a non-profit at the AI Action Summit in Paris in February 2025 and backed by serious capital (\$400m already committed). They launched their Gap Map a couple of days ago - an attempt at indexing the current state of open source AI: The Gap Map v0.1 details 421 products in depth: 266 software tools and libraries, 85 models, 50 datasets, and 20 hardware projects, produced by 228 organizations. These products are organized into 14 categories across 3 layers of the stack (model components, product / UX, and infrastructure). The remaining 24,400 artifacts constitute the uncategorized long tail of the open source AI ecosystem, and will carry no score until they are researched and cited. The map itself is interesting to explore, but I'm more excited about the underlying data - released under an MIT license in the currentai-org/os-ai-map GitHub account: 1,184 YAML files plus the notebooks, schemas and other scripts used to help gather them. Since the files are on GitHub you can use Datasette Lite to explore some of them - here are 16,185 GitHub repos the project is tracking as a CSV file...

2. Quoting Josh W. Comeau

Source: Simon Willison's Weblog | Published: 2026-07-03T21:25:52+00:00

I just launched my third course, Whimsical Animations, and so far, it's on track to sell roughly ? as many copies as a typical course launch. It's a similar story with my two existing courses. Sales are down significantly from last year. There are likely a lot of reasons for this, but I think the biggest is AI. There's sort of a double whammy with AI: Many people are wondering whether developer jobs will even exist in a few months, so they're reluctant to spend time/money learning new dev skills. Even if they do want to learn new dev skills, LLMs can provide personalized tutoring, so there's less incentive to buy a paid course. [...] I've spoken to a few course creators now, and we're all seeing the same trend. Revenue down 50%+. Fewer people engaging with our content. People switching to LLMs, which slurp up all of our work and regurgitate it, without consent or compensation. ? Josh W. 3. Fable's judgement

Source: Simon Willison's Weblog | Published: 2026-07-03T18:51:06+00:00

Link: <https://simonwillison.net/2026/Jul/3/judgement/#atom-everything>

One of the most interesting tips I got from the Fireside Chat I hosted with Cat Wu and Thariq Shihpar from the Claude Code team at AIE on Wednesday was to let Fable (and to a certain extent Opus) use their own judgement rather than dictating how they should work. The example they gave was testing. You can tell Fable "only use automated testing for larger features, don't update and run tests for small copy or design changes" - but it's better to just tell Fable to use its own judgement when deciding to write tests instead. Jesse Vincent just gave me a related tip to help avoid burning too many of those valuable Fable tokens in the few days we have left before the prices go up. Tell Fable to use other models for smaller tasks, applying its own judgement about which model to use. I prompted Claude Code just now with: For all coding tasks use your judgement to decide an appropriate lower power model and run that in a subagent Claude saved this memory file in
~/claude/projects/name-of-project/memory/delegate-coding-to-subagents.md : --- name: delegate-coding-to-subagents description: Simon wants coding tasks delegated to subagents running an appropriately lower-power model metadata:...

4. How did we conclude that CcNamespace.dll was the ringleader of a group of DLLs that unloaded prematurely?

5. ? Claude?s Criminally Bad Electron Mac App Is an Inside Job

Source: Daring Fireball | Published: 2026-07-03T21:24:05Z

Link: https://daringfireball.net/2026/07/claudes_criminally_bad_mac_app_is_an_inside_job

Felix Rieseberg, quite obviously, is the answer to the question why Claude is an Electron app. It?s like wondering why all the screws in a building were hammered into the walls, and then finding out that the guy who oversaw construction founded and co-owns the world?s biggest hammer manufacturer.

6. I Repeat Myself (5G vs. LTE Edition)

Source: Daring Fireball | Published: 2026-07-02T20:32:31Z

Link: <https://daringfireball.net/linked/2022/03/23/5g-battery-life>

Back in March 2022, Nicole Nguyen of The Wall Street Journal compared the battery life effects of 5G vs. LTE by streaming videos on several iPhone and iPad models. She found that using LTE saved significant battery life. (It would be nice if someone re-ran similar tests on more recent devices ? just because it was true with the iPhone 13 Pro doesn?t mean it?s true with current models. But I?ll bet it is.) Anyway, linking to her report, I wrote: With both regular 5G and LTE, I typically get between 50?100 Mbps down ? and I see a regular 5G connection far far more often than I do 5G ultra wideband. I don?t see any practical advantage to regular 5G compared to LTE. Those crazy-fast ultra-wideband download speeds are like owning a car that can go 200 MPH. So I?m just going to set my iPhone to use LTE all the time and save battery life. I?ll turn 5G Auto back on if I ever run into a situation where my LTE signal seems weak or slow. Which rings several bells with my ? A Tale of Two Modems ? post yesterday, regarding an AppleInsider report that data stolen from Apple supplier Tata Electronics shows that Apple is going to use Qualcomm?s mmWave-supporting cellular modems only in models of...

7. Truth Social Is Still Just Trump?s Blog

Source: Daring Fireball | Published: 2026-07-02T19:38:45Z

Link: https://daringfireball.net/2025/06/truth_social_is_just_trumps_blog

After I linked to Commerce Secretary Howard Lutnick posting on Twitter/X about the Trump administration allowing Anthropic to once again release Claude Fable 5, I was reminded once again that no one else in the Trump administration uses Truth Social other than Trump himself. Not even Lutnick, a lickspittle among lickspittles. * The rest of them all use X. Which in turn reminds me of my observation from a year ago : I?ve been thinking about this for a few weeks, and in that time, Trump?s own posts on Truth Social have made the news on a near-daily basis. I?ve never once, ever, seen a post from anyone else on Truth Social make the news. Trump is not just the one and only person of consequence using it, his is the one and only account on Truth Social that you ever, ever hear about. If Truth Social were actually meant to compete with X, Threads, Bluesky, and Mastodon, this almost certainly would have been a source of conflict between Trump and Musk. Because, if it were meant to be an actual competitive social network, it would occur to Trump to require all his flunkies and toadies not only to post to Truth Social, but to stop posting to X. But he hasn?t done that, because Truth Social...

8. Go maps, hashes of map keys, and pointers: a little surprise

Source: Chris?s Wiki :: blog | Published: 2026-07-04T02:02:38Z

Link: <https://utcc.utoronto.ca/~cks/space/blog/programming/GoMapsHashesAndPointers>

Go?s maps are famously implemented as hash tables, which is the only reasonable choice. The implementation has gotten somewhat more complicated since I looked at how maps store their values and keys due to the move to swiss tables , and these days you find the comments about how they work in internal/runtime/maps/map.go , but the core is still the same. Recently, a documentation commit landed in the Go development tree that opened my eyes to a bit of subtle

complexity I hadn't considered before in Go's map implementation. One of the things about hash tables is that they hash the value of keys down to some fixed size value in order to do operations more efficiently; in Go's current swiss tables, this is a 64-bit hash. Critically, the hash value of a key must be constant (which can be an issue in languages like Python that let you define a hash function at user level). You also want the actual value of keys to (only) compare equal when they are equal, which can also be a challenge in a language with user defined comparison functions, or just if you're dealing with NaNs. Go has a quite broad definition of what's allowed as map keys; you can use any type that has == and != compariso...

9. Does additional data always reduce posterior variance?

Source: John D. Cook | Published: Sat, 04 Jul 2026 02:50:36 +0000

Link: <https://www.johndcook.com/blog/2026/07/03/does-additional-data-always-reduce-posterior-variance/>

A discussion over lunch today brought up the fact that additional data does not always decrease the size of a confidence interval. This post will look at this from a Bayesian perspective. In general, new information reduces your uncertainty regarding whatever you're estimating. The posterior distribution becomes more concentrated as more data are collected. That's [?] The post Does additional data always reduce posterior variance? first appeared on John D. Cook.

10. The Fall and Rise of Screwworm

Source: Construction Physics | Published: Fri, 03 Jul 2026 12:02:57 GMT
