moonshotai/Kimi-K3 As promised earlier this month, Moonshot have released the weights for their excellent 2.8 trillion parameter Kimi K3. They're a hefty 1.56TB on Hugging Face. Kimi introduced their own janky modified version of the MIT license with K2 back in July 2025. That license just added this paragraph requiring attribution beyond a certain size of commercial entity: Our only modification part is that, if the Software (or any derivative works thereof) is used for any of your commercial products or services that have more than 100 million monthly active users, or more than 20 million US dollars (or equivalent in other currencies) in monthly revenue, you shall prominently display "Kimi K2" on the user interface of such product or service. The K3 license no longer calls itself "modified MIT" and goes further, requiring a separate agreement with Moonshot for large "Model as a Service" businesses: If the Licensee or any of its affiliates operates a Model as a Service business, and the aggregate revenue of the Licensee and its affiliates exceeds 20 million US dollars (or the equivalent in other currencies) in total over any consecutive 12 months, the Licensee must enter into a...

2. An opinionated guide to which AI to use to do stuff

Source: Simon Willison's Weblog | Published: 2026-07-27T21:55:53+00:00

Link: <https://simonwillison.net/2026/Jul/27/an-opinionated-guide-to-which-ai-to-use-to-do-stuff/#atom-everything>

An opinionated guide to which AI to use to do stuff It's interesting watching the evolution of Ethan Mollick's guide over time. A year ago it was still all about chat - ChatGPT, Claude, Gemini - with o3, Claude 4 Opus, and Gemini 2.5 Pro as the models and Deep Research as a useful alternative mode. Today it's much more about agentic systems - "where the AI is capable of doing the equivalent of many hours of real human work in one go". Gemini has fallen off Ethan's list, since Google still doesn't have an established entry in the Codex/ChatGPT Work/Cowork category. Gemini Spark has yet to prove itself! Ethan offers a useful explanation of the ways you can give ChatGPT or Claude a computer to use: To use the computers provided by the AI companies, the mode you want is called ChatGPT Work in ChatGPT, and Cowork in Claude (the naming will not get less confusing, I am sorry to say). [...] The most powerful way to use AI is to give it access to your computer. You do that by downloading the ChatGPT or Claude apps and picking a mode to use. ChatGPT's two agent modes are Work and Codex; Claude's are Cowork and Code. The names do not map onto each other in any way that will help you remember...

3. [Sponsor] Introducing Agent Fone

Source: Daring Fireball | Published: 2026-07-28T01:31:54Z

Link: <https://fail.xyz/phone/>

Every phone now ships with an assistant. You ask, it answers. Lame. We built a phone that writes software instead. The app idea you've had in your notes for years. The side hustle you will never get around to building. The weird thing only you would want. Describe it, answer a few questions, and it's on your home screen - yours, working, sendable to a friend. No app store between you and your ideas. The first fifty units go to teams who'll push on it and tell us what breaks. ?

4. ?Always Choose the Good Soap?

Jason Snell: Apple's most valuable asset is its brand. Not its real estate, not its intellectual property, not even any particular product. Even the mighty iPhone has no value if, over time, the traits that differentiate it from competitor products are erased. Apple's brand has always stood for higher quality products - you pay more, but you get more. Apple has never

wanted to be the low-price leader. It didn't put stickers on the first Intel Macs to get some marketing dollars from Intel. It doesn't load up new Macs with loads of lousy bundled third-party software like so many PCs do. Those are choices Apple has made that cost the company revenue, but they've got a bigger purpose. They reinforce the brand. Opting not to add more revenue to the bottom line is a difficult choice for anyone working at a profit-driven corporation. Great minds write about the same topic on the same day. What Snell's column makes clear is that the incremental revenue Apple is gaining from putting shitty ads in its software comes at a price. They're withdrawals from Apple's brand equity. And I would argue that the value they're detracting from the brand far out-values the dollar amount they'd padding to...

5. ? Ads in Software Are Like Stickers on Laptops

The latest issue of Paged Out! has an article by Stephen Hewitt "An off-line backup of your cryptographic key using playing cards." The idea is to use a deck of 52 to store a 128-bit cryptographic key. To erase the key, shuffle the deck. Hewitt gives his algorithm for embedding a key, one that can [?] The post Hiding data in permutations first appeared on John D. Cook .

8. Counting permutations with roots

Source: John D. Cook | Published: Mon, 27 Jul 2026 16:03:44 +0000

Link: <https://www.johndcook.com/blog/2026/07/27/counting-permutations-with-roots/>

My post from yesterday on permutation roots ends with a Mathematica code for finding the probability that a permutation of n elements has a k th root. This is done by finding the coefficient of x^n in the generating function I wanted to say more about this, and look at implementing the same code in SymPy. 9. Printing floating point numbers in binary

Source: John D. Cook | Published: Mon, 27 Jul 2026 15:34:05 +0000

Link: <https://www.johndcook.com/blog/2026/07/27/float-binary/>

It's well known that you can convert the base 16 (hex) representation of an integer to the base 2 (binary) representation by simply converting each digit from hex to binary. For example, $\text{CAFE}_{16} = 1100\ 1010\ 1111\ 1110_2$. I imagine it's less well known that you can do the same thing with floating point numbers. [?] The post Printing floating point numbers in binary first appeared on John D. Cook .

Upcoming appearances: Edinburgh, Sydney, Melbourne, Brighton, London, South Bend. Recent appearances: Where I've been. Latest books: You keep readin' em, I'll keep writin' 'em. Upcoming books: Like I said, I'll keep writin' 'em. Colophon: All the rest. How the EU can punish Google (despite Trump) (permalink) The "Serenity Prayer" (Serenity to accept things I can't change/Courage to change the things I can/Wisdom to know the difference) is usually cited as pop psychology or addiction recovery advice, but I think there's a place for it in policymaking....

11. Digital circuit simulator in Haskell (SICP 3.3)

Source: Entropic Thoughts | Published: Mon, 27 Jul 2026 00:00:00 +0200

Link: <https://entropicthoughts.com/sicp-3-3-digital-circuit-simulator-in-haskell>

I have a copy of SICP, or as it is also known, The Wizard Book . This book is widely praised, but I can't take the time to work my way through all of it. Instead, I'm going to occasionally jump into the parts of it that look interesting. In the previous two installations of this series, we looked at ways of implementing generic functions. In the first one, by tagging values and dispatching operations on tags. In the second case, by filling a mutable table of operation?tag pairs. We saw how these are roughly equivalent to the existing Haskell features of sum types and type classes. Now we'll simulate a digital circuit. The reason this is interesting is that the solution in SICP uses hidden mutable state and message-passing to make the code object-oriented. It even uses a mutable global variable for scheduling! I wasn't sure if it would be possible to replicate that in Haskell, but as we'll see, it can get incredibly close. (Continue reading the full article on the web.)

12. Can the Tide of AI Investment Lift All Boats on the Web?

Source: Jim Nielsen's Blog | Published: Mon, 27 Jul 2026 19:00:00 GMT

Link: <https://blog.jim-nielsen.com/2026/tide-lifts-all-boats/>

Jason Grigsby has a great article where he surfaces an opinion from the Safari team about how AI agents shouldn't get special treatment: An agent acting on a user's behalf is, in effect, assistive technology : it should operate a site as the user would, and the site should not single it out for different treatment. Jason synthesizes different discussions happening at standards levels to argue, in essence, that agents should be required to use existing technologies and solutions (APIs, semantics, etc.) rather than get their own bespoke ones. And where there are gaps in the platform, solutions should be centered around closing those gaps generally for everyone (vs. specifically for agents). Imagine that! Take the billions being invested in AI and funnel it towards improving and enhancing the existing technology agents already use and profit from. No bespoke solutions just for AI, but generalized solutions everyone can benefit from. In other words: allow the rising tide of AI investment to lift all boats in the platform because the web is for everyone. As Jason says: If we're solving this problem for AI, perhaps we can find a solution that works for end users too. His suggestion bein...
