

1. tencent/Hy3

Source: Simon Willison's Weblog | Published: 2026-07-06T23:57:35+00:00

Link: <https://simonwillison.net/2026/Jul/6/hy3/#atom-everything>

tencent/Hy3 New Apache 2.0 licensed model from Tencent in China: Hy3 is a 295B-parameter Mixture-of-Experts (MoE) model with 21B active parameters and 3.8B MTP layer parameters, developed by the Tencent Hy Team. Following the Hy3 Preview launch in late April, we gathered feedback from 50+ products and scaled up post-training with higher quality data. Today, we introduce Hy3, which outperforms similar-size models and rivals flagship open-source models with 2-5x parameters. It also shows significant gains in utility across various products and productivity tasks. The full-sized model is 598GB on Hugging Face, and the FP8 quantized one is 300GB . The context length is 256K. It's available for free on OpenRouter until July 21st . I had it "Generate an SVG of a pelican riding a bicycle" there and got this: Tags: ai , generative-ai , llms , pelican-riding-a-bicycle , llm-release , ai-in-china

2. sqlite-utils 4.0rc3

Source: Simon Willison's Weblog | Published: 2026-07-06T05:40:08+00:00

Link: <https://simonwillison.net/2026/Jul/6/sqlite-utils/#atom-everything>

Release: sqlite-utils 4.0rc3 I hoped to release sqlite-utils 4.0 stable this weekend, but as I worked through the backlog of issues and PRs with a combination of Claude Fable 5 and GPT-5.5 the changelog since rc2 kept getting bigger . The biggest new feature is support for introspecting and creating compound foreign keys - a feature that involves a subtle breaking change to table.foreign_keys and hence needed to land for the 4.0 stable release. sqlite-utils also now follows SQLite's convention for case insensitive column names, which turned out to touch a bunch of different places at once . 3. ? Apple Should Eliminate the App Icon ?Squirrel Jail?

Source: Daring Fireball | Published: 2026-07-06T22:23:46Z

Link: https://daringfireball.net/2026/07/eliminate_app_icon_squirrel_jail

Shape was often the most iconic thing about an icon. Now it's no part at all.

4. Markdown Now Has a UTI in Apple's Version 27 OSes

Source: Daring Fireball | Published: 2026-07-06T20:38:43Z

Link:

<https://developer.apple.com/documentation/uniformtypeidentifiers/uttype-swift.struct/markdown>

The third developer betas of Apple's 27 OSes dropped today, and this new page in Apple's developer documentation drew my attention ? a built-in Uniform Type Identifier for Markdown data: UTI: net.daringfireball.markdown Conforms to: public.utf8-plain-text I had previously recommended conforming to public.plain-text but stated that the text encoding should be UTF-8. I've updated my own recommendation to public.utf8-plain-text to enshrine the UTF-8 encoding. (Back in 2004 UTF-8 support was far from universal. Today it is.) ?

5. Backblaze Versus Dropbox

Source: Daring Fireball | Published: 2026-07-06T18:34:38Z

Link: <https://mjtai.com/blog/2025/12/19/backblaze-no-longer-backs-up-dropbox/>

There's been a lot of (justified) concern and consternation over the last year regarding Backblaze ? an online backup service whose simple pitch is that it backs up your entire computer, including the startup drive and external drives ? and online file storage services like iCloud Drive, Dropbox, Google Drive, and Microsoft OneDrive. Backblaze stopped including the contents of such services in its backups. Michael Tsai (as usual) collected a long list of links regarding this . The whole thing is complicated and confusing. The basic gist, I think, is that Backblaze has stopped trying to back up the contents from these services because

sometimes the files aren't really there on your local file system, but they sorta kinda look like they're there. That's what I meant in my post earlier today about Maestral regarding Apple's modern File Provider APIs. You know how sometimes in iCloud Drive ? or Dropbox or OneDrive or anything else that might use these APIs ? you can see a file or folder in the Finder, but there's a ?cloud? icon next to it, and you have to click the cloud icon to actually download it? That. With Maestral none of that comes into play. Maestral just keeps a folder on y...

You can't change your mind, but you can do it a different way. The post I opened a file with `FILE_FLAG_DELETE_ON_CLOSE` , but now I changed my mind appeared first on The Old New Thing .

7. Amazon Basics, but for intellectual property.

Source: Software and Tech stories from an Insider - iDiallo.com | Published: Mon, 06 Jul 2026 07:00:00 GMT

Link: <https://idiallo.com/blog/amazon-basics-but-intellectual-property>

Amazon has been accused several times for ripping off merchants on its platform. And every single time they denied any wrongdoing. A merchant, or anyone really, can create a product (or source it from China), then resell it on amazon. Amazon is the service provider, and hosts all the metrics concerning the products. If Amazon themselves were in the business of creating and selling products, then that creates a potential of conflict of interest. Because they have the data of all products that sell and sell well. They could replicate that success without doing any further research since the merchant has already confirmed the existence of demand. It's not surprising that Amazon Basics quickly became the best selling "private-label brand" on Amazon. They already know what sells because they have access to the data. Yet they continued to deny it, and state that they only ever use publicly available data from sellers . An Amazon spokesperson said the company believes the allegations are "factually incorrect and unsubstantiated," adding that Amazon strictly prohibits the "use or sharing of non-public, seller-specific data for the benefit of any seller, including sellers of private brands...

8. Life with hazard ratios

Source: DYNOMIGHT | Published: 2026-07-06T00:00:00+00:00

Link: <https://dynamight.net/hazard-ratios/>

If you read anything about health or longevity, you'll soon find yourself in a world of hazard ratios. Some study might say that eating more fiber might change your risk of dying by a factor of $HR = 0.90$. Another might say that occasional smoking might change it by $HR = 1.30$. But how much should you care about that? Is $HR = 0.90$ or $HR = 1.30$ a lot? What if you don't want to eat more fiber? What if you like smoking? Instead of staring at a ratio 1 , a more sensible thing to do is think about life expectancy. 2 But is it possible to convert a hazard ratio to a change in life expectancy? You might reason as follows: Baseline life expectancy is around 75 years. And $HR = 0.90$ corresponds to a 10% decrease in mortality. So perhaps that hazard ratio corresponds to something like 7.5 extra years of life expectancy? Unfortunately, that's completely wrong. To see why, imagine that humans only die by playing Russian roulette. They start playing this once per day at the age of 75, with a revolver containing two bullets and six chambers. If you were to remove one of those two bullets, that would drop the person's risk of death by $HR = 0.5$. (One bullet versus two.) But life expectancy would bar...

9. Using Linux `tc` to limit the outgoing bandwidth of a web server

Source: Chris's Wiki :: blog | Published: 2026-07-07T03:06:40Z

Link: <https://utcc.utoronto.ca/~cks/space/blog/linux/TcLimitServiceBandwidth>

Suppose, not hypothetically, that you have a web server that's using as much of your server's bandwidth as it can get and you would like it to use less bandwidth than that, so that you can get a word in edgewise (for backups, for example) or just because you don't feel like donating

1/10th of your outgoing bandwidth in apparent perpetuity to people who should be building local caches. There are various ways you might do this, for example using FreeBSD pf on your perimeter firewall, but the lowest impact and risk option is to do it on the (Linux) web server itself with tc(8) , the Linux traffic control system. Conveniently I've already done a tiny bit with tc to fight bufferbloat latency . There are probably a variety of ways to do this in tc(8) , but what I'm using right now is mostly pulled from the Arch wiki . It goes like this: We have to switch our device, which is eno1 for me, to using Hierarchy Token Bucket as its top level qdisc (queueing discipline), and in the process set a default class that otherwise unclassified packets will be assigned to. `tc qdisc del dev eno1 root tc qdisc add dev eno1 root handle 1: htb default 30 r2q 1000` Following the Arch example, the default cl...

10. Reproducing a geometry theorem diagram

Source: John D. Cook | Published: Mon, 06 Jul 2026 14:22:35 +0000

Link: <https://www.johndcook.com/blog/2026/07/06/arc-hypotenuse/>

The segment AB is a diameter and the line CD is perpendicular to the diameter. Assume the outer circle is a unit circle. I guessed $C = (\cos(1), \sin(1))$ and made the [?] The post Reproducing a geometry theorem diagram first appeared on John D. Cook .

11. e approximation

Source: John D. Cook | Published: Mon, 06 Jul 2026 12:22:29 +0000

Link: <https://www.johndcook.com/blog/2026/07/06/e-approximation/>

I ran across the approximation $e \approx 2721/1001$ recently. What makes this remarkable is its accuracy relative to the size of the denominator. You can create a trivial approximation just by truncating a decimal expansion $e \approx 2718/1000$ but this is only good to four significant figures, but $2721/1001$ is good to seven, almost eight, [?] The post e approximation first appeared on John D. 12. Stephan's Quintet

Source: Maurycy's Blog | Published: Mon, 06 Jul 2026 00:00:00 +0000

Link: <https://maurycyz.com/astro/h92/>

North is right (mirrored). 0.53"/pixel [17'x12' field]. FWHM=3.7" Ok, this is a crazy one. Five tightly spaced galaxies with visible tidal interactions: However, looking at redshift data, the blue spiral on the left is ten times closer than all the other objects: at $z=0.0026$ instead of $z=0.022$. This means it's not actually a member of the group, even though it's in the same part of of the sky. The dim barred spiral below the cluster (NGC 7320C) is at a redshift of $z=0.022$, making it a proper member of the group. This interloper takes the total back to five, so there's no need to rename the cluster. Speaking of names, this cluster is also known as Hickson Compact Group 92 and as Arp 319. There's a weird double galaxy : NGC 7318. It looks like a barred spiral galaxy, but has two nuclei, so it's the result of a recent galaxy collision. The NGC 7318 pair is also interacting with NGC 7320C, a true barred spiral, although heavily distorted: one of it's arms is stretched into massive tidal plume extending 2 arcminutes below it. Total exposure time: $501 * 30$ seconds = 4.2 hours. Used in stack: $437 * 30$ seconds = 3.6 hours. Telescope: C9.25 (230mm, f/10, fl=2300mm) + 0.63 Starizona reducer C...
