

1. llm-anthropic 0.27

Source: Simon Willison's Weblog | Published: 2026-08-24T16:27:04+00:00

Link: <https://simonwillison.net/2026/Aug/24/llm-anthropic/>

Release: llm-anthropic 0.27 This release of the Anthropic plugin for LLM mainly provides compatibility with the recently released anthropic v1.0.0 Python library, which switches from httpx to httpx2 . OpenAI made the same change in their v3.0.0 release two weeks ago. Anthropic provide this migration guide for upgrading to 1.0, so I prompted Fable 5 in Claude Code with:

Upgrade to anthropic>=1 - read

<https://raw.githubusercontent.com/anthropics/anthropic-sdk-python/refs/heads/main/MIGRATION.md>

and get the tests passing Here's the resulting PR . Tags: python , httpx , llm , anthropic , claude

2. Your executable is a SQLite database

Source: Simon Willison's Weblog | Published: 2026-08-24T11:38:15+00:00

Link: <https://simonwillison.net/2026/Aug/24/your-executable-is-a-sqlite-database/>

Your executable is a SQLite database Farid Zakaria describes a neat Linux pattern for creating a SQLite database file that can be directly used as an executable binary. The trick sets the SQLite file format's 4-byte application ID (68 bytes into the file) to SELF, standing for Structured Executable & Linkable Format. The various components of the ELF executable format are then arranged into a number of different SQLite tables, using this schema . Their self-exec interpreter (C code here) can then extract and execute the necessary pieces. You can additionally use a Linux mechanism called binfmt_misc to teach the kernel to execute that any time it encounters an executable matching that binary pattern. Farid uses NixOS here, but without NixOS I think registration looks something like this: `printf '%s\n'`

`':self:M:68:SELF::usr/local/bin/self-exec:' \> /proc/sys/fs/binfmt_misc/register` Via Hacker

3. [Sponsor] Finalist 4: Inspired by Paper Day Planners

Source: Daring Fireball | Published: 2026-08-25T00:37:24Z

Link: https://www.finalist.works/?utm_source=df-aug-2026

Finalist 4 is the biggest update yet to the paper-inspired day planner for iPhone, iPad, Mac, and now Apple Watch. The headline is Notes, in the app or as a folder of Markdown files that round-trips with Obsidian. Tasks in those files land on the right day, next to your reminders and events, even inside the macOS menu bar app. The rebuilt Timeline lets you pencil tasks into your day, and Apple Pencil gets special powers to sketch the plan in seconds. There's tons more, brewed over four months with 1,000 beta testers. Try it free on the App Store. ?

4. Apple Rethinks Plan to Merge ?Hide My Email? Domain Name With ?Sign In With Apple?

Source: Daring Fireball | Published: 2026-08-24T23:33:50Z

Link: <https://developer.apple.com/news/?id=1ptvdtcm>

Apple Developer News: Starting later this year, new Sign in with Apple addresses, previously issued on `privaterelay.appleid.com` , will be issued on `private.icloud.com` . Existing addresses on `privaterelay.appleid.com` will continue to work and forward mail to users without interruption. After further consideration and reviewing community feedback, iCloud+ Hide My Email addresses will remain on `icloud.com` . Back in June, Apple announced plans to merge both systems onto the new `private.icloud.com` domain. The objection to this plan was rather obvious: it's fine for Sign In With Apple to use an easily distinguishable domain name, because the only sites that see such email addresses are those that support Sign In With Apple (SIWA). The problem with moving Hide My Email (HME) addresses to a distinguishable domain name is that we often want to use such hidden email addresses on sites that would prefer to block those addresses and try to force us to use our ?real? addresses. A little birdie suggested to me after I wrote about it in June that there were strong objections to the merger internally all

along, from the HME side. Seems like those objections have won out. ?

5. ? What Is the Point of the DMA?

Source: Daring Fireball | Published: 2026-08-24T22:47:20Z

Link: https://daringfireball.net/2026/08/what_is_the_point_of_the_dma

If you believed that the point of the DMA was to open up competition, choice, and freedom for developers, yeah, I bet it does seem bonkers that the European Commission has signed off on compliance where Apple charges 15 percent commissions on links to the web from apps distributed on the App Store, and that Apple will collect a 5 percent Core Technology Commission even for apps distributed on third-party app marketplaces, using third-party payment processing.

7. Anger, Anxiety and Agency

Source: Armin Ronacher's Thoughts and Writings | Published: 2026-08-24T00:00:00+00:00

Link: <https://lucumr.pocoo.org/2026/8/24/anger-anxiety-agency/>

Sean Goedecke wrote a post arguing that you should never be angry at work ? a post with which I strongly agree. Anger can be a useful signal, but being angry at work rarely improves the situation. More often, it makes life worse for the people around you, many of whom have no more power over the source of your anger than you do. I did learn that lesson, but it did not come naturally. One thing in particular that I learned is that in a company there is a shared vision, and if you don't agree with it and are not in a position to change it, you should not start a mutiny, not even a small-scale one. Nothing good comes from that. In the discussion around that topic, one of the most upvoted comments on the Lobsters thread asked a question I had to think about quite a bit: How can you work in tech right now and not be angry? In the context of the thread, this was clearly also about AI and agents. For me, the emotions I would expect in tech vis-a-vis these new developments are disorientation and anxiety, but not anger. Anxiety as an emotion does not require someone to blame. Right now, I find it reasonable to feel anxious about an uncertain future. Who knows what our professions will turn...

8. Numerical (in)stability of recurrence relations

Source: John D. Cook | Published: Tue, 25 Aug 2026 01:47:47 +0000

Link: <https://www.johndcook.com/blog/2026/08/24/numerical-instability-recurrence/>

The previous post gave several examples of three-term recurrence relations for special functions. These relations can be computationally useful, but they have to be applied carefully. Several years ago I wrote a post on stable and unstable recurrences. In that post I show that the stability of the recurrence relation for Bessel functions produces depends [?] The post Numerical (in)stability of recurrence relations first appeared on John D. Cook .

9. Three-term recurrences

Source: John D. Cook | Published: Mon, 24 Aug 2026 14:14:55 +0000

Link: <https://www.johndcook.com/blog/2026/08/24/three-term-recurrences/>

There many examples of families of functions where each function can be computed as a linear combination of the two previous terms where a and b are functions of x but not on n . This is called a three-term recurrence formula. It's amazing how often you can run into three-term recurrence formulas. There are theorems that give conditions [?] The post Three-term recurrences first appeared on John D. Cook .

10. The von Mises-Fisher distribution

Source: John D. Cook | Published: Mon, 24 Aug 2026 14:14:25 +0000

Link: <https://www.johndcook.com/blog/2026/08/24/von-mises-fisher/>

Probability density function must integrate to 1, and so if you know a density function up to a constant, the constant is determined. When you're looking at a probability density $f(x)$ for the first time, it helps to ignore the normalizing constant. Concentrate on the part of the function involving x and know that the normalizing [?] The post The von Mises-Fisher distribution first appeared on John D. Cook .

11. Why do audience members choose specific shows at the Edinburgh Fringe?

Source: Terence Eden's Blog | Published: Mon, 24 Aug 2026 11:34:45 +0000

Link: <https://shkspr.mobi/blog/2026/08/why-do-audience-members-choose-specific-shows-at-the-edinburgh-fringe/>

On our recent trip to the Edinburgh Fringe, I was bemused by just how little effort performers put in to finding out why people had selected their show. Taking a show to the Edinburgh Fringe is ridiculously expensive with some performers paying tens of thousands of pounds. The way performers recoup the costs of performing is by getting people to pay to see a show. Acts are spending huge amounts?

12. Getting an LLM to Make Me a Tool for Enriching the Color Metadata in My Icon Collection

Source: Jim Nielsen's Blog | Published: Sun, 23 Aug 2026 19:00:00 GMT

Link: <https://blog.jim-nielsen.com/2026/use-llm-to-add-color-metadata/>

On my icon gallery sites , I have metadata I've manually added over the years to tag certain icons as being predominantly ?blue? or ?orange? or some other color. Then I use this metadata to present icons of (roughly) the same color. It's kinda neat to be able to browse a wall of icons that are all the same color. The thing is: I know there are a lot of icons I've missed tagging over the years. But I have no idea how many, and figuring that out seems like a really arduous task. How do I go through 2,000+ icons and find all the ones that look predominantly ?orange? but haven't been tagged as such yet? Seems like a good task to throw at an LLM. But I don't want to just say, ?Go tag everything that's missing? and blindly trust the output. I need to be able to make a decisions as to whether I think a particular color is ?orange? or not. What I need is a tool for the job. I'm a very visual thinker, so to continue curating these color categorizations, I need some way for the computer to do its thing really, really fast, and then pull me into the loop to visually make decisions. Here's how I am thinking about about accomplishing this task: Create a page with a list of colors on the left (...)
