

1. Claude Fable is relentlessly proactive

Source: Simon Willison's Weblog | Published: 2026-06-11T23:35:17+00:00

Link: <https://simonwillison.net/2026/Jun/11/fable-is-relentlessly-proactive/#atom-everything>

After two days of experience with Claude Fable 5 I think the best way to describe it is relentlessly proactive . It knows a whole lot of tricks and it will deploy pretty much any of them to get to its goal. I'll illustrate this with an example. I was hacking on Datasette Agent today when I noticed a glitch: a horizontal scrollbar that shouldn't be there in the jump menu chat prompt. I snapped this screenshot: Then I started a fresh claude session in my datasette-agent checkout, dragged in the screenshot and told it: Look at dependencies to help figure out why there is a horizontal scrollbar here I had a hunch the cause was in a dependency of Datasette Agent (likely Datasette itself) and I knew Fable was good at digging into dependency code, either by inspecting installed files in its own virtual environment site-packages or by referencing a local checkout on disk. Telling it to start with dependencies felt like a good bet. I got distracted by a domestic task and wandered away from my computer. When I came back a few minutes later I saw my machine open a browser window in my regular Firefox and then navigate to the dialog in question . I had not told Claude Code to use any browser...

2. datasette 1.0a33

Source: Simon Willison's Weblog | Published: 2026-06-11T15:26:49+00:00

Link: <https://simonwillison.net/2026/Jun/11/datasette/#atom-everything>

Release: datasette 1.0a33 This alpha is a significant step on the road to a stable 1.0, finally extending the `?_extra=` pattern I introduced in Datasette 1.0a3 to cover queries and rows in addition to tables. That pattern is also now documented ! I wrote a whole lot more about the new release on the Datasette project blog: Datasette 1.0a33 with JSON extras in the API . Because API explorer tools are almost free to build now I had Claude Fable 5 in Claude Code (for the plan) and GPT-5.5 xhigh in Codex Desktop (for the implementation) build me this custom extras API explorer to help demonstrate the feature: Tags: projects , datasette , annotated-release-notes , ai-assisted-programming

3. asyncinject 0.7

Source: Simon Willison's Weblog | Published: 2026-06-11T06:28:09+00:00

Link: <https://simonwillison.net/2026/Jun/11/asyncinject/#atom-everything>

Release: asyncinject 0.7 I built this utility library to support an asyncio dependency injection pattern a few years ago. I was using it with Datasette and Claude Fable 5 spotted some bugs in the dependency which it then fixed for me. It's a very proactive model! Tags: async , projects , python , claude-mythos

4. Apple: ?Due to DMA, Siri AI Delayed in EU for iOS 27 and iPadOS 27?

Source: Daring Fireball | Published: 2026-06-11T21:58:49Z

Link: <https://www.apple.com/newsroom/2026/06/due-to-dma-siri-ai-delayed-in-eu-for-ios-27-and-ipados-27/>

Apple Newsroom, in an Apple Newsroom post Monday: According to EU regulators, the DMA requires Apple to give any AI system nearly unlimited access to a user's device, as well as the ability to act on that access autonomously without a user's ongoing visibility and control. That includes the ability to read and send messages, make purchases, access files, and execute actions across any app. Security researchers have already shown that AI systems can be hijacked to steal personal data ? like passwords and photos ? and to permanently alter files and account settings without a user's consent. As AI systems gain more capabilities, these risks are quickly increasing in frequency and scope. Given the serious risks to users, Apple designed a solution called Trusted System Agent ? an intermediary that would allow virtual assistants to safely access the same features and capabilities as Siri AI for devices in the EU. Apple also

shared a plan to launch Siri AI in the EU while gradually rolling out this new solution over an 18-month period. The European Commission said no. In fact, the European Commission did not agree to any of Apple's proposals. Apple will continue working to bring these fe...

5. Spielberg on Being Repeatedly Turned Down to Direct a James Bond Film

Source: Daring Fireball | Published: 2026-06-11T20:38:09Z

Link: <https://www.youtube.com/watch?v=iEho3brGB64>

Steven Spielberg, on The Rest Is Entertainment on YouTube: I approached Cubby Broccoli after Jaws was a big hit. I'd always wanted to make a James Bond film from the day I saw Dr. No, so I called Cubby after Jaws and volunteered. I said, 'If you need a director, I would love to direct one.' And he said no. And he moved on. And then Cubby called me again after Close Encounters came out. And that was a big hit. And Cubby called me a few years after Close Encounters and said, 'We'd like to use the five notes in Moonraker.' And I said, 'I'll make you a deal. I'll give you permission to use the five notes if you let me direct a Bond film.' And he said 'Nope.' But I gave him the five notes anyway. In Moonraker, the iconic Close Encounters notes are the passcode to the locked door of a secret lab that Bond (Roger Moore) needs to enter. Probably not so secure to play the passcode digits audible, but it's a fun Easter egg. I always presumed that EON used it as fair-use homage, without bothering to ask Spielberg or Columbia Pictures for permission. Spielberg, in his interview with The Rest Is Entertainment, goes on to explain the oft-repeated story that his disappointment over his reject...

6. Apple Introduces Siri AI

Source: Daring Fireball | Published: 2026-06-09T17:23:29Z

Link: <https://www.apple.com/newsroom/2026/06/apple-introduces-siri-ai-a-profoundly-more-capable-and-personal-assistant/>

Apple Newsroom yesterday: This new version of Siri is built on Apple Intelligence, allowing Siri to draw on personal context understanding and help users find what they need in the moment across messages, emails, photos, and more. For example, users can ask Siri to find a restaurant recommendation a friend messaged them about, surface a hotel confirmation number from an old email, or pull up photos with friends and family from a recent trip. And personal context understanding extends to third-party apps when developers integrate with Spotlight. With even more systemwide app actions, Siri AI lets users get things done across apps, like drafting an email from scratch, or editing and sharing a set of photos. Using onscreen awareness, Siri AI can answer questions related to the content on a user's screen. For example, if a user gets a text about a potluck with friends, they can brainstorm with Siri on what to bring and then add a recipe to the Notes app. In addition, Siri AI can use broad world knowledge to get up-to-date information from the web on virtually any topic and generate a helpful answer, such as when and where to see the next solar eclipse, or when a musician is coming to...

7. What's the opposite of ClipCursor that lets me exclude the cursor from a region?

Source: The Old New Thing | Published: Wed, 10 Jun 2026 14:00:00 +0000

There is no such feature, but you can just exclude it virtually. The post What's the opposite of ClipCursor that lets me exclude the cursor from a region? appeared first on The Old New Thing.

8. Solving a chess puzzle with Claude and Prolog

Source: John D. Cook | Published: Thu, 11 Jun 2026 13:14:26 +0000

Link: <https://www.johndcook.com/blog/2026/06/11/prolog-claude/>

Prolog is the original logic programming language. The name comes from programming in logic. More specifically, the name comes from programmation en logique because the inventor of the language, Philippe Roussel, is French. Prolog has its advantages and disadvantages. One of the advantages is that the language represents logical problems directly. One of the disadvantages [?] The post Solving a chess puzzle with Claude and Prolog first appeared on John D. Cook.

9. Why disk warranties are useful at work but not for me at home

Source: Chris's Wiki :: blog | Published: 2026-06-12T01:40:54Z

Link: <https://utcc.utoronto.ca/~cks/space/blog/tech/DiskWarrantyHomeVsWork>

I've been using my home desktop for many years now, with a variety of disk drives, and over those years some of those disks have failed (without data loss, because I use software RAID mirrors). Some of the time, those failures have happened when the HDD was still under warranty, but despite that I've never bothered to try to return one for a warranty replacement. This is strikingly unlike work, where we routinely return failed drives that are still under warranty. Historically there have been two things that changed my behavior at home. The first is that when a disk drive fails in my home system, my priority has always been to restore redundancy as fast as possible. Sending a drive in for warranty replacement and waiting for the new one would take weeks, and I don't want to run a non-redundant setup for that long, so I've always gone out and bought a replacement drive immediately. The second is that a lot of the time, the failed disk was old enough that the replacement HDD I'd be buying was bigger, which typically meant that I had little immediate use for a smaller than I now wanted warranty replacement drive. (In retrospect, spare HDDs for backups were one use, but I'm lazy.) Nei...

10. What Happened to tea.xyz

Source: Andrew Nesbitt | Published: 2026-06-11T10:00:00+00:00

Link: <https://nesbitt.io/2026/06/11/what-happened-to-tea.html>

On June 4th, tea.xyz launched what it had been promising since 2022: a cryptocurrency that pays open source maintainers. Within the first hour of official trading, the token fell 75% from its opening price. A week later it trades about 90% below its first-day high, the company's GitHub org has been near-silent for six months, and the founder's public commits are going to a different project entirely. Their own blog post from June 8th, titled *The Work Continues*, concedes the right response is not to pretend the launch went the way we wanted. It did not. I've been pulling the public data: GitHub commit history, on-chain trading records, and the long paper trail tea left across the package registries. Where tea came from tea was founded by Max Howell, the creator of Homebrew, with Timothy Lewis. It came out of stealth in March 2022 with \$8M led by Binance Labs, followed by an \$8.9M seed round in December 2022. The pitch had two halves: a new package manager (the tea CLI), and a blockchain protocol that would reward the maintainers of open source packages with tokens. Howell wrote Homebrew and made nothing from it, and the pitch leaned on that history, famous Google interview reje...

11. Biological Evolution and Information Acquisition

Source: Construction Physics | Published: Thu, 11 Jun 2026 12:01:31 GMT

Link: <https://www.construction-physics.com/p/biological-evolution-and-information>

A few weeks ago we looked at a simulation of technological evolution by economist Brian Arthur, in which he was able to start with simple building blocks (such as a NAND gate) and evolve surprisingly complex circuits (such as a 12-way AND gate or a 4-bit adder) by randomly combining increasingly useful existing components.

12. My Portable Heater

Source: Tedium: The Dull Side of the Internet. | Published: 2026-06-11T03:52:47Z

Link: <https://feed.tedium.co/link/15204/17359582/gigabyte-aorus-5060-ti-ai-box-egpu-review>

This new eGPU barely works in Linux, gets quite hot, and is based on tech gamers already rejected. So why am I so excited about it?

13. Hacking Google with A.I. for \$500,000

Source: Brutecat • Research | Published: Thu, 11 Jun 2026 00:00:00 GMT

Link: <https://brutecat.com/articles/hacking-google-with-ai>

What happens when you unleash an AI across all of Google's infrastructure? 1,500 APIs, 3,600 keys, and \$500,000 in bounties later, here's what I found.
