

1. A Record-Breaking Patch Tuesday for June 2026

Source: Krebs on Security | Published: Tue, 09 Jun 2026 22:07:28 +0000

Link: <https://krebsonsecurity.com/2026/06/a-record-breaking-patch-tuesday-for-june-2026/>

Microsoft today released software updates to plug nearly 200 security holes across its Windows operating systems and supported software, a record number of fixes for the company's monthly Patch Tuesday cycle. Nearly three dozen of those bugs earned Microsoft's most dire "critical" rating, and exploit code for at least three of the weaknesses is now publicly available.

2. If Claude Fable stops helping you, you'll never know

Source: Simon Willison's Weblog | Published: 2026-06-10T00:37:25+00:00

Link: <https://simonwillison.net/2026/Jun/10/if-claude-fable-stops-helping-you/#atom-everything>

If Claude Fable stops helping you, you'll never know Jonathon Ready highlights one of the more eyebrow-raising details from the 319 page system card for Fable 5 and Mythos 5. Here's a longer excerpt, highlights mine: In light of the ability of recent models to accelerate their own development , we've implemented new interventions that limit Claude's effectiveness for requests targeting frontier LLM development (for example, on building pretraining pipelines, distributed training infrastructure, or ML accelerator design). Using Claude to develop competing models already violates our Terms of Service , but enforcing this restriction through our safeguards avoids accelerating the actors most willing to violate these terms. Unlike our interventions for cybersecurity, biology and chemistry, and distillation attempts, these safeguards will not be visible to the user . Fable 5 will not fall back to a different model. Instead, the safeguards will limit effectiveness through methods such as prompt modification, steering vectors, or parameter-efficient fine-tuning (PEFT). These interventions will not affect the vast majority of coding work. We estimate they will impact ~0.03% of traffic, c...

3. Initial impressions of Claude Fable 5

Source: Simon Willison's Weblog | Published: 2026-06-09T23:59:54+00:00

Link: <https://simonwillison.net/2026/Jun/9/claude-fable-5/#atom-everything>

I didn't have early access to today's Claude Fable 5 release, but I've spent the past ~5.5 hours putting it through its paces. My initial impressions are that this is something of a beast . It's slow, expensive and has been quite happily churning through everything I've thrown at it so far. As is frequently the case with current frontier models the challenge is finding tasks that it can't do. First, let's review the key characteristics. Anthropic claim that Claude Fable 5 offers the same performance as Claude Mythos 5, except with much more strict guardrails in place to prevent it being used for harmful things. Those guardrails trigger often enough that the Claude API has new mechanisms for letting you know when you hit them, and even has a new option to request it falls back to another model automatically if something gets rejected. Claude Mythos 5 is out today as well, Anthropic say it "Shares Claude Fable 5's capabilities without the safety classifiers". The models have a 1 million token context window, 128,000 maximum output tokens and a knowledge cut-off date of January 2026. They are priced at twice the price of Claude Opus 4.5/4.6/4.7/4.8: \$10/million input tokens and \$50/m...

4. llm 0.32a3

Source: Simon Willison's Weblog | Published: 2026-06-09T22:27:03+00:00

Release: llm 0.32a3 Almost entirely written by the new Claude Fable 5, see my write-up for more details . Tags: projects , ai , generative-ai , llms , llm , claude-mythos

5. Apple OS 27: The Small Things

Source: Daring Fireball | Published: 2026-06-09T21:29:57Z

Link: <https://blog.oneberri.com/posts/wwdc26-the-small-things>

Rishi ÓMy favorite Apple updates are not the flashy new features, but the quiet little

touches: annoyances fixed, workflows made smoother, rough edges sanded down, and longstanding flaws thoughtfully reworked. To me, they're the clearest sign of a company that cares about its craft. Here's a collection from a WWDC26 screen-grab, organized for easier reading, on improvements coming later this year. That's a lot of bullet points. ?

6. The Talk Show Live From WWDC: Tonight, In-Person and Streaming

Source: Daring Fireball | Published: 2026-06-09T18:53:47Z

Link: <https://ti.to/daringfireball/the-talk-show-live-from-wwdc-2026>

If you can make it in person, you should come. The California Theater is a beautiful big theater and tickets are still available . You can also watch tonight's show in live stereoscopic immersive in the Theater app from Sandwich Vision on Vision Pro. A purchase of the ticket to the live show, the Theater app for \$12.99, is also good for replay forever ? with surprise bonus features included. It's a fun, truly immersive way to experience the show. Hope to see you there tonight, one way or the other. ?

7. Apple WWDC 2026 Keynote

Source: Daring Fireball | Published: 2026-06-09T17:42:32Z

Link: <https://www.youtube.com/watch?v=hF8swzNR1-o>

A brisk 76 minutes, including the post-credits Easter egg music video. The past few years ran about a half hour longer. ?

10. "No way to prevent this" say users of only language where this regularly happens

Source: Xe Iaso's blog | Published: Tue, 09 Jun 2026 00:00:00 GMT

Link: <https://xeiaso.net/shitposts/no-way-to-prevent-this/memory-safety/CVE-2026-45447/>

In the hours following the release of CVE-2026-45447 for the project OpenSSL , site reliability workers and systems administrators scrambled to desperately rebuild and patch all their systems to fix a heap use-after-free in PKCS7_verify(). This is due to the affected components being written in C, the only programming language where these vulnerabilities regularly happen. "This was a terrible tragedy, but sometimes these things just happen and there's nothing anyone can do to stop them," said programmer Prof. Fabian Greenholt, echoing statements expressed by hundreds of thousands of programmers who use the only language where 90% of the world's memory safety vulnerabilities have occurred in the last 50 years, and whose projects are 20 times more likely to have security vulnerabilities. "It's a shame, but what can we do? There really isn't anything we can do to prevent memory safety vulnerabilities from happening if the programmer doesn't want to write their code in a robust manner." At press time, users of the only programming language in the world where these vulnerabilities regularly happen once or twice per quarter for the last eight years were referring to themselves and their...

11. Pluralistic: Naomi Kritzer's "Obstetrix" (09 Jun 2026)

Today's links Naomi Kritzer's "Obstetrix": When forced birth cultists become forced obstetrics

militants. Hey look at this: Delights to delectate. Object permanence: DD-WRT; iTunes DRM is illegal; Fingertip magnet; Sony passwords v Gawker passwords; RIAA recants on 3 strikes; Parachute wedding dress; Roald Dahl (jerk); "Level Up"; The rent's too damned high; RIAA v "Search by artist"; "Robocalypse"; You are not a wallet; The man who created the religious right; NY x voting; NY x antitrust; Media companies fund Heritage Minister's campaign; Richard Dreyfuss x iTunes EULA; 3-way street; RIAA lawyer becomes Solicitor General; Brock Allen's wrist-slap; Ad-tech interop; Apple's manorial security; Billionaires aren't taxed, "Rabbits." Upcoming appearances: Kansas City, LA, Menlo Park, Toronto, NYC, Edinburgh, South Bend. Recent appearances: Where I've been. Latest books: You keep readin' 'em, I'll keep writin' 'em. Upcoming books: Like I said, I'll keep writin' 'em. Colophon: All the rest. Naomi Kritzer's "Obstetrix" (permalink) Naomi Kritzer's Obstetrix is a new, tense thriller in the mode of Atwood's Handmaid's Tale and Alderman's The Power; it's a beautifully turned, claustrophobic...

12. CSS: Unavoidable Bad Parts

Source: matklad | Published: 2026-06-04T00:00:00+00:00

Link: <https://matklad.github.io/2026/06/04/css-unavoidable-bad-parts.html>

An ersatz CSS tutorial for people who need to style a web page, but aren't web developers. I am a wrong person to write this kind of thing, as I have neither the time, nor experience. I'd much rather read a book about this. Alas, I had to learn all this stuff from trawling MDN, so perhaps it is valuable to document what I have so far.

13. Understanding Embark in GNU Emacs (a bit) and some 'stupid' Embark tricks

Source: Chris's Wiki :: blog | Published: 2026-06-09T03:46:37Z

Link: <https://utcc.utoronto.ca/~cks/space/blog/programming/EmacsUnderstandingEmbark>

When I wrote about the Emacs packages I use , I mentioned that I had Embark installed but barely used it because I didn't understand much about how to really use it. One reason for that is that while there are a bunch of articles on the web about things you can do with Embark, all of the ones I've tried to read started out with complicated stuff involving other third party packages I didn't use, which caused me to tune out and stop reading. As sometimes happens, writing that entry caused me to poke at Embark some more and now I have a somewhat better understanding of it and some Embark tricks I want to remember. (Now that I've made the effort to read it, Fifteen ways to use Embark has a bunch of useful examples that use only built in packages. Also, part of my confusion is that Embark actually does multiple things.) With Embark, you start with a 'something' (what Embark calls a target) and then Embark lets you to do an assortment of things to it; some Embark writeups describe this as a middle mouse button context menu. There are at least two ways to get the 'something' (cf). In a regular buffer, it's whatever is at point (or the region if you have one active); in the minibuffer...

14. Forms of Open Source Government

Source: Andrew Nesbitt | Published: 2026-06-09T10:00:00+00:00

Link: <https://nesbitt.io/2026/06/09/forms-of-open-source-government.html>

Benevolent dictator for life. The founder keeps final say over project direction in perpetuity, by convention rather than written rule. Python ran this way until Guido stepped down in 2018, and Linux, Ruby, Rails, and Laravel still do. The unspoken upper bound on ?in perpetuity? is one human lifespan, which none of the famous projects in the category have had to test yet. Malevolent dictator for life. The same arrangement after the benevolence has worn off, with the founder still in the chair and nobody around with the access or the energy to do much about it. From outside it shows up as long-time contributors going quiet and forks appearing in places that do not usually fork. Steering council. What a BDFL project becomes after the dictator retires or is asked to. The usual shape is a small elected committee with rotating seats and no permanent membership, as in Python's transition to a five-person Steering Council via PEP 13 and PEP 8016 after Guido stepped down. Most BDFL projects do not write a succession plan in advance and end up improvising one in whatever crisis prompted the handover. Permanent core team. A long-lived group of recognised maintainers joined by invitation and...

15. LLMs and almost good code

Source: Entropic Thoughts | Published: Tue, 09 Jun 2026 00:00:00 +0200

Link: <https://entropicthoughts.com/llms-and-almost-good-code>

TL;DR: My new prior is that top-of-the-line LLMs working on easy tasks generate code that is maybe 10 % more complicated than necessary. I also think we accept this complexity too easily, because it comes from code that is right here , right now , solving an immediate problem. This may have consequences for maintenance in the long term. The background to this discovery was that I needed to do some CRUD plumbing in a work project. It was a simple change that mostly mirrored existing functionality. This is a perfect fit for LLMs, in my experience, so I used a frontier model to generate the code for it. The change ended up being a total of just over 200 lines, mostly additions. The part of the generated code we?ll talk about is a 24-line function that converts an arbitrary (user-supplied) string to a safe HTTP header value. (Continue reading the full article on the web.)

16. Incorruptible

Incorruptible: Why Good Companies Go Bad? and How Great Companies Stay Great, by Eric Ries. Every once in a while a book comes along that doesn't just change your tactical thinking, but makes you see the world in a different way. Reading this book is like taking the red pill in the Matrix. Some will [?]

17. Active recall

Source: Herman's blog | Published: 2026-06-09T14:50:05.835536+00:00

Link: <https://herman.bearblog.dev/active-recall/>

Quick aside: My sister has a Bear blog called Notes on Making where she writes about knitting, wool dying, pattern design, and shows off what she's created. If you're into wool and crafting, take a look. It's really cool! I'm currently reading What I talk about when I talk about running by Haruki Murakami (thanks for the recommendation, Rishi) and a line stuck out to me: Perhaps I'm just too painstaking a type of person, but I can't grasp much of anything without putting down my thoughts in writing. This line resonated with me because I've also found that the best way for me to understand a concept or idea is for me to write about it. Reading only gets me so far. The act of articulating what is stored in my brain into something legible and understandable is thinking and understanding. I worry about the education system, which has had the entire concept of writing as a form of study upended by AI, and universities have seen their first decline in literacy and comprehension ever recorded. But this isn't what this post is about, this post is about remembering things. I have often received complements from friends and strangers alike on how good my memory is. This tends to be complime...
